AUSTIN, Texas, Sept. 23, 1992 - Motorola's High Performance Microprocessor Division today announced that its 68030 provides the processing power for Atari Corporation's new Atari Falcon030, the industry's first personal integrated media system. The Atari Falcon030 is a full-scale computer based on the powerful 68030 and is specifically designed for personal integrated media functions including video, audio, animation, telecommunications and graphics. Users of the Atari Falcon030 can create home videos complete with text and music; can record lead vocals on a favorite musical recording; can narrate and score a family photo album and can execute many more exciting applications.

The Atari Falcon030 also incorporates Motorola's 56001 digital signal processor (DSP) to process and manipulate compact-disc-quality digital audio and voice signals which, combined with the 68030's processing power and Atari's integrated software, makes the Atari Falcon030 a complete personal integrated media system. This announcement is an example of how microprocessors are entering the home through the burgeoning availability of consumerized computing devices.

"With the introduction of the Atari Falcon030, Atari is raising the standards of consumerized computing to a new level, providing integration of text, music and images with unparalleled levels of quality, performance and price," said Jim Reinhart, Motorola's manager of M68000 marketing and applications. "The robust processing capabilities of the 68030 make it an ideal microprocessor for such a graphically-based product as the Atari Falcon030."

"The Atari Falcon030, with the help of Motorola's 68030 and 56001 DSP, is bringing production-quality graphics, professional-level recording and audio manipulation capabilities to the consumer," said Sam Tramiel, president and CEO of Atari. "The processing power of Motorola's 68030 allows the Atari Falcon030 to be a powerful full-scale computer, giving users access to a new world of applications while remaining affordable."

The Motorola 68030 integrates advanced features into a full 32-bit microprocessor design, optimized for low-cost, memory-based applications. Its burst fill functionality provides an efficient bus and memory interface, enabling the 68030 to substantially increase overall system throughput. This capability is especially well-suited for multimedia personal integrated media products, such as the Atari Falcon030, that require large amounts of information to be continuously transmitted from external memory to the processor's dual internal caches. The efficient memory interface results in cost and time savings, allowing the Atari Falcon030 to achieve excellent price/performance ratios.

Available immediately, the Atari Falcon030 is priced under $1,000, making it ideal for users who want a powerful, efficient and cost-effective device to harness today's myriad technologies.

Atari Computer Corporation is a worldwide manufacturer and marketer of palmtop through desktop computer systems. The company, a division of Atari Corporation (AMEX:ATC), sells its systems, peripherals and software through authorized distributors, resellers and integrators.

3067. Re: Finding x,y resolution

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 01:49:00 UTC
From: Dirk_Steins@k2.maus.de
Message-ID: <A47933@K2.maus.de>
Source record: 217158

d>the function XBIOS(4) yields the following results:
d> 0 for low rez
d> 1 for mid rez
d> 2 for hi rew

Yeah, that's true. But what about the TT? What about the Falcon? What abour graphic cards? What about cheap screen enhancers (like overscan)?

The only save way to get the screen resolution is to use the VDI. Don't use the XBIOS for something like that!

Regards, Dirk

Why do we have to read stuff like that? Ok, here some real answers.

yoshi@gate.powerplay.ac.at (Yoshi Yellow) wrote:

y>Can you raytrace on a falcon? Besides raytracing over night(s) ?
Yes! The Falcon is powerful enough for that. It's not as good as a silicon graphics, but it is good (enough for most people).

y>Can you do multitasking on a falcon ? I mean, REAL multitasking ?
Yes! Take a look at MultiTOS and keep your mouth shut!

y>Is a 030/16MHz machine that fast that you can digitize and manipulate
y>such pictures without falling to sleep?
Yes! That's only a problem of good software (and this software exists!).

y>>Can you use a mouse with a famicom?
y>Yes. Soon.
Very interesting answer! Playing 'Super Mario World' with a mouse :-))

y>>Can you run calamus on a famicom?
y>Who bothers about Calamus. There are some *better* MS-Dos applications.
Good joke. Just talk about real things that you know something off. Calamus is one of the best DTP programs in the world, and i don't know any PC-Program that's better than Calamus. Quark X-Press is quite good, i don't know if there is a PC-version yet, but i think a TT with Calamus is much better than any PC with Windows and Quark.

y>As I said, for everything besides playing one could use the PC.
Oh, really. Never heard something intelligent like that. You can do a digital frequency analyser on a PC (without x-tra hardware)? You can do CD-quality sound with a pc? You can do a modem only with a little bit of hardware and mostly software on a pc? Sounds very interesting, i think i would buy such a pc. But i don't know any PC that allows all these things to this price and without extra costs.

3073. Boston Computer Society shows Falcon 030!

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 02:29:24 UTC
From: selick@csa.bu.edu
Message-ID: <96643@bu.edu>
Source record: 217106

Well, I just got back from downtown Boston, where the Boston Computer Society gave the first public appearance of the Falcon 030 to the public (me). I forgot a notepad, so these notes are direct from the back of business cards...please bear with me if I get a name mispelled... :-)

Bob Brodie started off the meeting, and immediately introduced Sam Tramiel after some boring business. Sam spoke for a bit on the history of Atari, and such, and then brought out Richard Miller, the head of the Falcon development team. He went into all of the gory details of the guts of the machine, all of which have already been confirmed numerous times already on the net.

Perhaps the most exciting part of the night was when they announced several software packages that will be bundled with every falcon...

Falcon 2d2 - software from Atari to start using the 8 channel direct to disk stuff immediately when you get your machine! Yeah Atari!!! We saw a brief demo of this program...very impressive!

System Audio Manager - attach sampled sounds to any system command, including a different sound for each key (note that these are handled by the dsp chip and do not detract from normal operations!)

Audio Fun Machine - This is a cute dsp program to show the capabilities of the dsp chip for sound processing. It does reverbs, and a DISTORTION! Very cool little program.

Calapt - calendar/appointment utility
ProCalc - Calculator prog
Talking Clock - you figure it out!

2 GAMES especially designed to show off the Falcon!
Land Mines and Breakout!

The prices they gave were consistant with net postings...$799 for the 1 meg, and 1,299 for the 4 meg/65 meg version.

These items are direct from Sam Tramiel:

November - start shipping first units
December shipping in quantity (for x-mas I suppose...)
January - relief quantities for backorders will be shipped.

Then came the q/a section, and some interesting facts came out...

There are osciliscope programs using the dsp in the works...do fft's and all on your waveforms in "near real time"

They played a Tina Turner video made in Australia of "You're the Best". 3 minute video took 100 meg of hard drive space which included video & audio. They used a 14 meg machine, and said it would not yet work on a 4 meg machine, but they have a compression algorithm in the works that may make it work...they also said the video was 24 frames per second.

A company called Sack in Germany has a functioning 386sx board ready for production.

Sam Tramiel said that "NeXT developers are coming to us and asking for developement systems because they expect that we will sell more falcons in 1 month than NeXT sells in a year! ... We sure hope so!"

He also said that Amiga developers, unimpressed with the 4000 are also coming to Atari for development kits.

He said the Jaguar would be out in the summer of 93, and would not comment on it further because this was a "Falcon meeting"

They forgot the multitasking os disk...typical...

The roms will have different languages burned right in them to allow Atari to ship computers to different countries with the same roms. The disk will be for "minor updates, and language specific material" whatever that means. The roms will be 4 meg worth!

The Falcon will actuall display ST monochrome mode on a standard SC1224 color monitor! In total, they said that the Falcon supports over 130 different screen modes and resolutions.

At the end, they played a complete sample of Boston's "Foreplay/Long Time". Sampled at 50 khz, it took 96 meg of hard drive space.

They also mentioned that Atari was working on software modules to read and write different floppy disk formats, including the mac GCR! Somebody asked if Dave Small had spectre working yet, and Sam Tramiel responded "Well...I saw him in our offices last week..." but did not know what he had accomplished yet.

When asked why they chose the 16 mhz 68030 instead of a faster one, Sam Tramiel said that with all of the separate processing centers (68030, dsp, blitter, optional co-processor, etc) that they felt the machine to be comprable to machines with faster "workhorse processors that have to handle everything". He said much faster machines would be appearing "very shortly".

Well, that's enough typing for me for one night...That's all I can remember. Oh...they gave away a falcon as a door prize, and I didn't win it...darn!

Enjoy,
-Steve <selick@csa.bu.edu>

3074. Anybody got Powerdos?

Newsgroup: comp.sys.atari.st

>of the old Atari series (like the 'amiga killer' STE).

At the Atari Messe there was an Atari Dealer calles 'ddd' (Digital Data
Deicke). In their catalogue they offer a case with seperate keyboard for
the FALCON 030 for DM 199.- (about US$ 140). So you can buy your FALCON
there with a cheap internal 3,5" SCSI Drive.

Is it an 8 or 16 bit proc. It couldn't possible be a 32 bit architecture.
How much memory (without bankswitching) can it handle?

Morten.

3080. Hot Lead

Please can some of you chaps from the USA, tell me which is the Hot/Phase lead in your Black/White wiring..

Like these European New/Old colours.

Brown or Red = Hot/Phase

Blue or Black = Neutral

Green/Yellow or Green = Earth

Black = ?

White = ?

Thanks.......

Roger.......... sheppard_r@kosmos.wcc.govt.nz

3081. New MIDI PLAYBACK version available

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 09:16:30 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Sep24.091630.22609@echo.philips.nl>
Source record: 217146

```
================================================================
| Sorry if you read this posting more than once, but it still |
| seems impossible to get crossposting working from this site. |
================================================================

Hi,

I am proudly presenting PLAYBACK version 1.1.

The PLAYBACK program can load and play standard MIDIFILES.
It can adjust a lot of parameters to adapt the file to your
personal midi setup, save and convert MIDIFILES, etc.

ATARI: This version runs on Atari systems only.
PC: Programming the PC/Windows version has just been started.
AMIGA: Somebody else has just started the port to the Amiga.

The new version has been emailed to the following archives:
------------------------------------------------------------

archive.cs.ruu.nl (131.211.80.5)
ATARI-ST/.... Email: mail-server@cs.ruu.nl

------------------------------------------------------------

atari.archive.umich.edu (141.211.164.8)
atari/.... Email: atari@atari.archive.umich.edu

------------------------------------------------------------

as well as to the moderator of newsgroup:
comp.binaries.atari.st

------------------------------------------------------------

Take care to get the latest version, which is 1.1 (or 1.10 if you prefer:-).
The zoo packet will contain a readme file saying so, otherwise, you have
an older version. The INFO function of the program does list the version too.

Required system:
================

The program will run on available atari 680*0 computers,
with all current TOS (in ROM) versions:

ST/STE/MEGA STE/TT/FALCON

512kB computer memory is sufficient, but more is recommended.

The program has been tested on monochrome and color monitors.
Note that the program has been written to work optimal with
medium (640*200) and high (640*400) resolution screens.
```

It will work on the new (higher) resolutions too, as long as
they allow (at least) 80 characters and 25 lines, using the
standard character size. Note that less characters and lines
will be used, due to the size of windows and alike (it uses
GEM on the Atari).

Major features:
===============

- PLAYBACK loads standard MIDIFILES. Both format 0 and 1 can be handled.
- Filters can be activated at loading to minimise memory usage.
- The program can handle up to 99 tracks.
- The loaded songs can be modified to be used with every MIDI device. The
following (undo-able) modifications can be made per track:
- MIDI channel;
- Volume;
- Event filters;
- Program changes (presets can be set as well as be mapped);
- Notes (keys can be transposed as well as be mapped).
- Key maps and program change maps can be created, saved and loaded.
- The tempo of the song can be modified.
- The modified song can be saved, allowing the MIDIFILE format to be
converted.
- Events can be analysed in the event editor.
- PLAYBACK can be installed on the desktop to automatically load and
play songs, when double clicked on a MIDIFILE, or when a MIDIFILE
is dragged on the program's icon (later TOS versions only!).
- PLAYBACK can run from CLI and shells.
- PLAYBACK uses GEM.
- Program preferences can be set and will be loaded automatically at
startup of the PLAYBACK program.
- Many more.

Changes since version 1.0
=========================

Personnaly, the most important changes have to do with efficiency.
This means, that I have put quite some effort in making the program
easier to use and that MIDIFILES can be modified easier and faster
for adapting it to your MIDI setup.

A. ALL KNOWN AND REPORTED BUGS HAVE BEEN SOLVED

- Window scrolling works ok now.
- Filters in the maps ("--") do work ok now.
- Timer A will be re-set at program exit.
- Key signature is shown correctly now in the editor
- Few other little things.

B. SUPPORT OF NEW HARDWARE AND SOFTWARE

- Program runs in a window (preparation for MULTITOS).
- Bigger screens/resolutions can be handled now.
- Program is compiled to run on all 68000-68030 processors.

C. NEW FEATURES

- Files can be saved.
- Converting MIDIFILE format is possible.
- Maps for program changes.
- MIDI channels can be converted at file load.
- Filters can be set for all tracks at once.
- More settings will be done automatically during MIDIFILE loading,
to allow faster and efficiency adapting the song to your MIDI setup.
- The program allows preferences to be set:
- Disabling "filter" question at file load.
- Disabling "Are you sure" question at program exit.
- Enabling the file selector to pop up at the start of the program.
- Immediately start playing the song when a new song has been loaded.
- Immediately exiting the program when the song has stopped (finished).
- Few more.
- Every preference can be used as flag/argument when started from a CLI.
- Preferences and maps can be loaded automatically at startup.
- All buttons and settings can be manupilated during song playing too.
- Changing volume and program changes, will result in a midi event being sent.
- Number box handling has been improved, to allow faster changes.
- Few other little things.

>>Can you raytrace on a famicom?
>
>Can you raytrace on a falcon? Besides raytracing over night(s) ?

Yes. Just run the program to do it. If you want a speed up by about a factor
of 10, buy a MC68882 and just plug it in the socket provided.

>
>>Can you do direct to disk sampling on a famicom?
>>Can you write your own software on a famicom?
>>Can you multitask on a famicom?
>
>Can you do multitasking on a falcon ? I mean, REAL multitasking ?

Yes. MultiTOS runs over MiNT which is a true, pre-emptive multitasking
kernel with a very low CPU overhead. Its system calls are modelled closely
on Unix. Would you describe Unix as a REAL multitasking OS? :-)

>
>>Can you digitize and view pictures in 65K colours on a famicom?
>
>Is a 030/16MHz machine that fast that you can digitize and manipulate such
>pictures without falling to sleep?

You'd use the 56001 DSP for all the CPU intensive stuff, the 68030 would
just be the controller.

>
>>Can you use a mouse with a famicom?
>
>Yes. Soon.
>
>>Can you run calamus on a famicom?
>
>Who bothers about Calamus. There are some *better* MS-Dos applications.

Tee-hee... sorry :-)

Have you ever used Pagermaker 3/4 on a PC under Windows (2 & 3)? I have, I
wouldn't want to foist that on anyone! Timeworks? Don't mention it!

Now if you are talking about rivals to Calamus you must look in the realms
of the Macintosh. Even there you will find it difficult to get as good a
product as Calamus (I know it's buggy) for the same price. Pagemaker 4 is
around 700 pounds to buy, you could almost buy a Mac Classic for that!

>
>>Can you run midi sequencing software on a famicom?
>>Can you add a keyboard to run decent flight sims on a famicom?
>
>Yes. Soon too.
>
>>Can you download software via ftp to run on a famicom?
>>Can you do anything at all but play games with a famicom?
>
>As I said, for everything besides playing one could use the PC.

I wouldn't touch the crippled PC architecture with a bargepole (sp?)
thank-you very much!

>
>>
>>Russell.
>
>Yoshi.

By the way, how much does the Nintendo cost? (How much will the Falcon cost?)

3084. ATspeed (or the like) for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 09:50:54 UTC
From: hjb@levi.th.vu.nl
Message-ID: <1992Sep24.095054.18767@cca.vu.nl>
Source record: 217144

I am sorry if this has been asked before, but I did not feel up
to reading all articles with only 'Falcon' as their Subject..

Will there be DOS (386) emulators for the Falcon? I am thinking
of the Vortex 386 card for ST and the like.
If there will be, this will make the Falcon into the machine that
has everything _I_ need (then I could even use it for my WORK :-).

Thanks in advance,

Hendrik Jan Bosman
hjb@th.vu.nl

3085. More RAW pictures

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 10:00:51 UTC
From: shore_c@kosmos.wcc.govt.nz
Message-ID: <19s3kjINNs96@golem.wcc.govt.nz>
Source record: 217142

I've just FTP'ed another file with raytraced .RAW pictures in it.

This time, there are 4 compressed LZH files inside a single lzh file.
The 4 files were just copied into the single lzh file with compression
off for convience so only 1 file needs to be FTP'ed.

The filename is rawfiles.lzh in /atari/new on atari.srchive.umich.edu

The file has been archived with -lh5- so you will need lzh201*.ttp
to unarchive it.

>> 1024x800 16 colors takes about 24 MB/s so the Falcon might handle
>> that too. 1024x800 mono is 6 MB/s so if possible would be great!

1. What I read somewhere is that it's the VGA bandwidth that caused
the limitiations of the Videl.

2. If you reduce the refresh rate (to, say, 40Hz for non-interlaced) you
will get a slightly higher maximum resolution.

3. If it IS just the memory bandwidth then we'd better wait for the 040
(but I bet that one will have the higher resolutions built-in)

Hey! you forgot something:

In the ST, the memory manager is ready to deal with 4MB.
Are you sure it is the same in the Falcon ?
I know that, cause a friend of mine wanted to upgrade his amiga 500
and I told him to do as I did with my 520ST. But, bad luck, to add
memory in his amiga he had to find a DRAM manager, for refresh,
address multiplexing, ... and he had to decode the address. Maybe
he had bad information on his amiga, but...

Anybody knows if the Falcon has everything 'ready to upgrade' ?

3092. ROM/Hard Drive Anomaly

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 14:17:37 UTC
From: hanka@icon.com
Message-ID: <1992Sep24.141737.15909@icon.com>
Source record: 217205

This may be a common problem but it is new to me. My old STFM
died and I purchased a used ST to replace it. The old STFM had
1.0 ROMs and the replacement ST has 1.4 ROMs. I have an Atari
Megafile 30 which I connected to the replacement ST. Whenever
I boot from the hard drive, the program (.PRG) files on the hard
and floppy drives show as normal files, not executables. I
can't execute any of the software on the hard drive unless I put
it in the AUTO folder. When I click on the program name or icon
I get the dialog box saying I can only print or show the file.

When I boot from floppy disk, turning off the hard drive, everything
works fine. Has anyone seen this before? What gives?

Steve Hanka

> (but I bet that one will have the higher resolutions built-in)

Hi, I Think one important thing has been forgotten in this thread... you can change the clock generater for the graphics subsystem, thus you could say increase it from 32Mhz to 60Mhz... and therefor get higher resolutions... as long as you stay within the bandwidth, the Falcon will not slow down... if you don't, the machine will slow down, but you can still have high resolutions(this was explained to me by the german atari rep in charge of developers, whose name I forget, as well as a person from Overscan, the company which makes mods for STs and TTs).

Bye, Bruno.

3094. Timeworks DTP and Word Perfect files!!

Newsgroup: comp.sys.atari.st

>on my 1040ST.

Ha! That's where they've got you, Jonathan. The Falcon does not use SIMMs but rather a proprietary memory board available _only_ from Atari. Trust me, they have been beaten severely over the head and shoulders about this stupid decision (IMHO) not to use industry standard SIMMs. And that's only ONE example of some really dumb things they have done in this machine's design. Don't take me wrong... the Falcon _is_ a nice machine. But when I think of what it COULD have been for little or no additional expense on Atari's part... GRRRRRRR!

Chris,

Do give Bob Brodie a call at Atari in Sunnyvale. I forget his extension but
you can call the switchboard at (408) 745-2000 and ask for him. If he is not
in (frequently due to road trips), just ask to speak to someone for User Group
support.

Good luck with your new User Group!

|>

This is correct, but there is also another thing to mention. There
is a big package distributed to all common computers (the ST included), which enables you to work with ppm-images.

The package is on a.a. In the graphics directory I guess.

3. The falcon has an internal HD floppy drive and you can easily add
additional floppy drives or hard disks or whatever you want via the
SCSI 2 interface.

I tried to reply to this by email, but it seems to have bounced.

I have a Mega STE, with 68881, and find an improvement with Laser C,
though I don't usually program in C.
You need to link in the '881 library with a line something like (from
Gulam):
d:\megamax>> ld -o sch881.prg init.o scheqn.o lib881.a libc.a

The order of the two math libraries (lib881.a and libc.a) is crucial. I
got a speed improvement of about a factor of 17 on the savage benchmark
(heavy use of transcendentals, where the FPU really shines),but less than a
factor of two improvement on a floating point intensive calculation not
involving transcendentals (just adds, multiplies, etc).

In article <1993@mwca.UUCP>, bill@mwca.UUCP (Bill Sheppard) writes:
>For what it's worth, Playback has yielded a world-wide total of one (1)
>shareware registration. This is pretty depressing, considering that it
>certainly seems to be a program of some value (especially the new about-to-
>be-released version), and arrangements have been made for both North American
>and European shareware registration. Bah.

I'm sorry to find you're a bit disappointed with the extent of shareware registrations at present. Considering the extent of distribution, though, and the time the program has actually been available, you are probably doing average for initial shareware.

I've been reading a bit on GEnie in the areas which deal with shareware for the Intel-clone markets. One example (to give you some hope...) was from a person who wrote a very nice package, put it out as shareware, and saw -- well, let's just say he didn't get rich the first year of the software's release. However, the second year he started to get more registrations, to the tune of $80,000 for the year. Admittedly, this is for a DOS program, with umpty zillion machines now out there capable of running the program.

Some things the person wrote about that helped:

Get the program to reviewers - mail out disks (and whatever things you're using to entice the buyer to pay the shareware fee) to Atari ST magazines, to music-oriented magazines that have a review section, etc.

Get the program out to more BBS's. The person who made $80,000 the second year says that it is typical in the Intel-clone world to send out 300-500 disks to various BBS/Online/DOM Services for each new program released as shareware! Make sure that the latest program version is in their hands

Other advice is available. There is a shareware handbook/guide in the MSDOS world for which much of the advice applies to the ST world as well (given the fact that there are a bit fewer computer owners of the ST, some modification is probably in order).

Shareware looks like an easy way to market a product, but it requires a bit more work than one would assume from a description of the concept.

>beginning to wonder about the Falcon . . .
>
>Does anyone have any info about running "ordinary" applications -
>notably Calamus and the French word processor Le Redacteur - on
>the Falcon?

Calamus _does_ work on the Falcon. Have not seen Redacteur run on the new "bird"
but I can't imagine why not. By and large, the Falcon is _more_ compatible with
existing ST applications than the TT is. MultiTOS may cause some older programs
a few problems, however.

Make no mistake, however, the Falcon should not be considered a replacement for
the TT as the TT is inherently more powerful. Then again, it all depends on what
you want to do with the machine. If you lean towards sound/music & graphics,
then the Falcon should be a real "contenda."
>
>Are the develeopers out there?

Yes. :)

Right you are, Joe, and my apologies to Jonathan if that was his intent. Just because it doesn't come that way from the factory is no reason to believe that some enterprising soul cannot develop a workaround to use SIMMs in lieu of the standard Atari memory board. And judging by the profusion of trace cuts, solder splashes, jumper wires, baling wire and band aids in my old original 1040, we Atarians have proven damned good at engineering new goodies in an old box.

Hey, hear that? That's the sound of opportunity knocking! :)

I've got a like-new copy of the latest version of Laser C (for the Atari ST) that is just sitting on my bookshelf. I've never used it, maybe someone out here can. I think it also has the separate debugger package(?) or something (like I said, I've never used it but I can check for you).

Make me a reasonable offer and it's yours.

In article <1992Sep22.071630.18726@actrix.gen.nz>
Steven.Wells@bbs.actrix.gen.nz writes:

>Very good gadget! Another good reason not to buy an atari, seeing as
>this does everything for a fraction of the cost!

This is a ludricous statement. No emulator is perfect and Gemulator
is no exception. From a preview I read there are many programs
incompatible with Gemulator, hard disk support is shaky, on a 486 runs
at 1.5 times a normal ST, and it requires 7 Mb of RAM when run under
DOS. Certainly some of these will change by final release, but I
wouldn't expect miracles.

>Darek has come up with a sure winner - When (IF) I manage to get rid
>of my ST, I'll have to try & buy it - but selling an atari is hard
>work, no one is interested in this country!

A winner? I think it will be a flop. It has no appeal to long time
MS-DOS users (which is the market for this product). Mostly ex-Atarians
will be interested in it (ST owners have always been a small market).
I'm not convinced there is any software so unique to the ST that any
DOS user couldn't find an equivalent product that would run much better
(in terms of speed and compatibilty) to justify the purchase of Gemulator.

3120. STZip 2.0 released

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 23:12:07 UTC
From: vincent@stell.fr.mugnet.org
Message-ID: <1992Sep24.231207.626@stell.gna.org>
Source record: 217196

I've uploaded STZip 2.0 to atari.archive.umich.edu as stzip20.tos (self extracting file, currently in /atari/new but will probably be moved).

STZip 2.0 is a major upgrade, with a new and better compression algorithm (compatible with Unzip 5.0 and Zip 1.9 recently released for Unix in alt.sources). It also adds crypting, updating and freshening zip files, creation and handling of self extracting files, interface that should work slightly better with MultiTOS, and a few other changes and bug fixes.

STZip is postcardware.

Okay. As much as I would like to belive the Super Famicom is just a HUNKY-DORRY piece of hardware, why is it I know no person who owns one, nor do I care?

Anyway, you say that if the Famicom doesn't do what the Falcon CAN do, the buy a IBM clone.

Well, see, the thing is, if you wanted to run a program better than Calamus, then you would probably go for Pagemaker or something similiar, and really, to run Pagemaker, you need at least a 386DX and VGA graphics, plus you have to pay for Windows 3.1 or OS/2 or whatever.

So, in the end, you pay around $1500 - $2000 for your PC system, when you could get the Atari Falcon for $1200-$1300? Plus the Falcon has excellent sound hardware, and you have to pay even MORE on the IBM to get that. Plus the DSP chip which everyone is raving about.

Plus a real multi-tasking GUI interface, and no 640k limit.

Show me a program on the IBM that is as easy to use and intuitive as GEM with TOS 2.06 and THEN I'll agree with you.

>to atari.archive?

The version I tried was INCREDIBLY buggy, and hogged over 200k of RAM, so I decided it wasn't worth it.

However, there is a newer version from whatever I was using, so maybe some of the bugs were fixed.

I am running a TOS 1.0 machine with 1 meg RAM, and it performed better than having FATSPEED and Pinhead installed, so it does show some promise, but not enough to warrant 200k of RAM on only 1 meg.

Okee doke. Your problem is the incompatibilities with TOS 1.0 and TOS 1.4 DESKTOP.INF files.

Delete your old DESKTOP.INF file and start from scratch (ie, boot up with no DESKTOP.INF and go from there, creating your ideal configuration).
The reason that .PRGs do execute in the first place is that there is a line in your DESKTOP.INF file that tells the computer that any file that is a .PRG should be executed.

And for some reason, TOS 1.0 and TOS 1.4 have very different formats for DESKTOP.INF so it doesn't work properly.

Thanks for backing me up Joe, and yes that was my intent, although I can
understand how John got confused by my lack of wording. Anyways, if there

is space for memory modules, I'm sure SIMM's could be fitted in (espessially those two chip models). However, my question still stands---How fast would they need to be? My guess is faster than 100ns?
Thanks,
Jonathan

3126. Falcon in Australia

From: swanee@megadata.mega.oz.au
Message-ID: <1992Sep25.000006.26928@megadata.mega.oz.au>
Source record: 217233

Greetings to all the OZ and NZ netters,
The Falcon030 is scheduled for release here in Australia in early 1993
and apparently will cost less than A$1000 at the entry level, which is
on par with the US$799 we hear on the net. I believe the marketing will
be done through the retailers rather than an official announcement and
organised show.

Sla/n go fo/ill,
Risky B.

3128. help with Uniterm macros...

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 00:12:21 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1686C10E15.C556212@mizzou1.missouri.edu>
Source record: 217236

I just spent about 2 hours trying to edit one of the sample macros from atari.archive for uniterm 2.0E and I have had it!!!
For some reason I can't get a reading from the terminal, and I cant do a send. (question: does r n mean return and linefeed?) I am trying to set up an autologin for my mainframe. (could the 7 bit Even Parity be throwing a wrench in my works?) I tried a command like:
ge('ENTER TERMINAL TYPE: ',20) w(10) se ('VT100')
but it never went off, it just sat there for a while and then the macro halted (because the timeouts had passed?) and I was in terminal mode.
Any help would be greatly appreciated...
Jeoff Hines c556212@mizzou1.missouri.edu

Wrong. Come on, John. YOu were at the Glendale show. If you listened to
Atari at all, then you should know better. They specifically stated several
times that the Falcon will use a custom, but NOT proprietary, memory
expansion board. They also said that third party memory boards are already
in the works, so they should be available from companies other than Atari.
Not that this helps the original poster to put SIMs in his machine, that should
still require a few band-aids or something. :)

vince@sci.kun.nl (V.G.J.M. Stoks) writes:

>Information about Processor Speed". The Falcon will be faster than the
>MIPS rating will show, since it has a 16MHz blitter and fast graphics.

Faster? don't forget single bus with no VRAM.
Yes caches on the 030 will mean normal thruput not drastically reduced by
graphics dma fetch hogging memory cycles - exception: in graphics work
there is no performance without memory cycles. Graphics work - window moving
etc... requires real memory bandwidth (locality caches don't help).

>The graphics are the part which slows a 386SX16 down so much you can't
>run Windows on it nicely unless you slap out a whopping amount of cash
>for a fast VGA card.

Fact: to do a fair comparison - imagine falcon in 640x480x256 [vga]
vs cheap 386 clone. Now a cheap 386SX@25 costs about $1500AU
[includes vga monitor, 40meg HD], with poor graphics card - say another $150
to upgrade to a decent graphics card. My guess a similar setup for the falcon
will come in around $2000AU.

Fact: regardless of video mode on ibm clone - the cpu will not be slowed
by video memory fetching - ie the thruput under a real multitasking OS will
be higher on the pc clone, but the graphics updates so slow... as we all know :)

However don't forget 640x480x256 is a huge mode compared with the old joke
modes on the atari ST. The windowing system will typically be moving around
10x the data of the old atari ST modes [2.4x for 480 vs 200, another 4x
for the new found bitplane depth] - add to this the burden this fetch places
on the single bus memory system. Now I'm not sure at what these vga modes
run at, but my guess is about 60Hz - thus the 640x480x256 mode chews over
18megabytes per second. Now what speed does the bus on the falcon provide?
My guess is the bus is a 32megabyte per second job [given that 640x480x65k not
possible] - although I spose it could possibly be 64 megabytes per second [I
doubt it tho]. The important thing out of all these numbers is that the
graphics system on the falcon will probably be reduced to a near crawl in
the 640x480x256 mode - so its unfair to call cheap 386 clones slow, when
the falcon will be in the same boat.

Summary:
Falcon will blow any computer away for sound.
Falcon will blow most computers away for game graphics.
Falcon will be mediocre in high res/colour GUI work.

I do believe that WizWorks has a CD which contains several Megs of clip art and ImageCat. The CD is either being marketed by WizWorks or Joppa. I think Joppa also has another CD but I'm not sure what's on this CD.

By the way, when you say "CD-ROMS" I'm assumming that you mean compact disks (CD's).

If you re-partition your hard drive, you're going to lose all the
information is contains. It is therefore necessary to save all you
files to disk (or some other media) so you can write it back to the
hard drive after you've re-partitioned it.

I think you're going to have to first save your WordPerfect files as TEXT
(ASCII) and bring it into TimeWorks DTP that way. This of course means
that you will have lost any underlining, SubScript, etc. you might have
created with WordPerfect.

Yes to all your questions. :^)

I've run it on my TT, but I didn't find any improvement. Others that use it on their STs have noticed great improvement in disk access. Some have noticed degradation in modem throughput. I don't run it on my TT because it doesn't have any benefits for me.

I'd post it to a.a if I had a good connection. Hopefully, someone else will get it on there.

>a big selling point...
>

It is suppost to be possible, but what i'm wondering is just what
does this DSP port have in the way of output/input... what does
it connect up to?
A more precise question would be how can it deal with all the phone stuff
like taking it off hook, putting it back on hook etc etc?

3140. upload to a.a.: TOS/MiNT bindings library for Turbo/Pure C

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 08:10:52 UTC
From: mh1@irz209.inf.tu-dresden.de
Message-ID: <OAC72OC@math.fu-berlin.de>
Source record: 217246
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,de.comp.sys.st

I just uploaded an archive containing a library with TOS/MiNT bindings for Turbo/
Pure C. From the distributions README:

```
------------------------------------------------------------------------------

-----------------------------------------
TOS and MiNT bindings for Turbo C / Pure C
by Ole Arndt, changes by Ulf Moeller
-----------------------------------------

OSBIND.LIB fully replaces PCTOSLIB. In contrast to the original Turbo C
library, this library is reentrant. All MiNT 0.95 bindings are implemented.

This library and the assembler sources may be freely copied.

EMail:
Ole_Arndt@f.maus.de
Ulf_Moeller@hh2.maus.de

------------------------------------------------------------------------------

This library is particularly interesting for Turbo C users who want to use the
Turbo/Pure C support in the next MiNT library.

I uploaded the archive (filename: pcosbind.zoo) to the following places:

atari.archive.umich.edu
ftp.rus.uni-stuttgart.de
ftp.uni-muenster.de

The archive should make it to the respective atari/programming or atari/mint
directory soon.

If you have questions concerning the library, forward them to
ulf_moeller@hh2.maus.de.

Michael

Oh it's not that bad. The Falcon memory board contains nothing but memory
chips so third party vendors will be making boards very cheaply anyway.
I'm pretty sure there will be upgrade boards that will take SIMMs too.

There are a bunch of files at atari.archive in the /printing (or /utilities?) directory called dj*.* and hp*.* -- amongst this lot is what you need to use your DJ500 with 1st Word, plus a whole lot more besides. I recommend getting your hands on all these goodies.

Cheers,

[M][a][r][c]

>Geoff Swan (research & development) _--_|\ swanee@megadata.oz.au

I think you have the price in OZZ completly wrong, even a 1040STE sells
there for some A800, also we have been quoted a NZ price of at least
nz$2500, so I think you will be dreaming of a A$1000 price, more like A$2300...

Roger..... sheppard_r@kosmos.wcc.govt.nz

>accepts 10. Just try !
Another possibility would be to use something like fdread on the IBM.
This is a small program that bypasses the MS-DOS check on the floppy
specs. It comes with FDFormat a program that allows disks formatted with
up to 100 tracks (if you want that :) and up to 21 or so sectors per
track (only on HD drives of coursE) limited to 10 on DD flops I think.
I also heard some rumors on the newer MSDOS versions accepting more
different formats but after trying the new DOS 5.0 I found no such
improvement. Of course they were afraid Atari would sue them for copying
their floppy control program.

Erlend.

The TT RAM boards have extra (custom) logic chips on the boards... I wonder if the Falcon030 memory boards are similar?

If they are then hacking SIMMs on would be quite difficult.

Really I reckon it would be far better if you guys the other countries
didn't mention how much you will be paying for your machines as I KNOW
that as usual we in England will be paying way over the odds for these
machines, typically in my experience we pay the same amount in UK
pounds as the Americans do in dollars!

Oh well such is life. (or c'est la vie for those language buffs).

Does anyone know why we always pay more in England? I've known cases
where it would have been cheaper to get on a ferry drive to Germany,
buy a machine and drive back, rather than buy from a UK distributor.

Mark

> Thanks for backing me up Joe, and yes that was my intent, although I can
>understand how John got confused by my lack of wording.

No problem, and me too. After looking at my post this morning, I feel
it had a flame feel to it that was not called for. I'm glad everyone
took it in stride.

As to the SIMM speed, I would think the machine would have wait state
handling. Hopefully they would work with 100ns chips, but would also
be able to take advantage of 70/60 ns chips. I don't know the specs,
but that would just seem to be good design.

I sold my ST a couple of years ago, and am really tired of using
clones. If the Falcon has even marginal success I'm sure I'll be
getting one.

Does anyone know if there is a sit that carries printer drivers! I've recently had an awful time trying to find a driver for a 24 pin calamus set-up! I scoured a.a.u.e and couldn't find a driver subdirectory or any real help in \printing, anyone know of another site? I have a lot of addresses of sites...but I don't really have time off-peak to call 20 sites and look blindly for drivers!!! As always thanks in advance for any help!

I have one that I did quite some time ago. If I remember it is fairly
complete for the the standard character set but I don't think that I did
much with the extended character set. I don't know how to send it to
the terminator, but I will be happy to e-mail you the .hex file. Send
me e-mail if interested.

From: ganderso@unlinfo.unl.edu
Message-ID: <1992Sep25.143407.16606@unlinfo.unl.edu>
Source record: 217165

I'm selling out! My entire ST library is hereby up for grabs.

All of the software listed below includes all the original packaging
and documentation. To make things simple, I'm pricing ALL of this
software at a flat $14 each, which includes postage. Which means
there are some REAL bargains in here.

I'll be glad to answer any questions I can about individual programs.
First come (via email) first served. (You might want to list an alternate
choice or two.) I've also got LOTS of public doman disks and ST magazines
(with disks). I'll throw some in with each order (proportional to the
size of the order) as long as it lasts.

>in the works, so they should be available from companies other than Atari.
>Not that this helps the original poster to put SIMs in his machine, that should
>still require a few band-aids or something. :)

Sorry, Doug, but I was corrected (and quite correctly) already by Joe Rohde
reference Jonathan's original message intent. I guess I missed Atari's
statement at Glendale about Falcon's memory board being custom but _not_
proprietary. It's difficult to attend all seminars when you have a booth to
man. Interesting though, as the word we (developers) have received before
was that the board _was_ proprietary but "not to worry as Atari will be a
great chip merchant" <quote-unquote>. Glad it's not proprietary after all.

And not to point any fingers, but people would be well-advised not to take
certain claims issued by Atari as "gospel". There _may_ be third party
memory boards in the works and there _may_ be 30+ "new" developers at work
hurriedly writing new Falcon apps and their _may_ be lots of other good news.
Being originally from Missouri, you've got to "show me" first. :) At any
rate, like I said before, I'm sure it will be possible to engineer a method
to incorporate standard SIMMs into the Falcon. My complaint was aimed at
Atari for not using SIMMs in the first place! Capiche'?

3156. Unix game "warp"

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 16:31:14 UTC
From: ken@isgtec.com
Message-ID: <3309@isgtec.isgtec.com>
Source record: 217184

Does anyone know of an ST port of the old Unix game "warp"? It was a real-time ascii graphics game loosely based on Star Trek, and it was great. I seem to recall seeing ports somewhere.

A long time ago I got the sources of zoo (approx. v2.1), compiled it
with gcc 1.? and it's libraries and it worked fine. I'm using
it even today. The UNIXMODE environment is fully supported.

If there is anyone interested in getting it, please mail a request to one of
my addresses.

(I've lost the sources mentioned above. It would be very nice if somebody
could tell me a server where I can find the latest version of zoo sources.)

>>>my drive, or can I just do it?
>>
>>
>>Just do it! That's what I say.

>No! I don't know of any possibility to manage your problem! If simply
>'just doing it' you'll loose all your data!

The next is working on my Vortex HDplus:

Look which partitions you wants to change. You will have to backup the
partitions you wants to change and all between. That meens, if you have
the partitions c, d, e, f, g, h and you wants to change partition c and h
than you will have to backup your whole HD. If you wants to change e and h
than you will have to backup e, f, g, and h. If you wants to change f and g
than f and g have to be backuped.

Than you repartition your HD without zeroing.

Restore the backuped partitions.

This is working with my Vortex HDplus. I didn't know, if it will work with
your HD. If you wants to go save than backup the whole HD.

Tschuess,
Alf

Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I've got an Atari STe with an SC1435 monitor, with an extra
mouse, which I will sell for $550 (split shipping costs
between us).

Also: DeskCart (cartridge, software, box and docs): $30

VideoKey (box and docs): $30

StereoTek 3-d glasses (complete with cartridge, extra
software, and a 3-d 'Breakout' game; compatible
with Cyber-Cad): $70

I'll pay the shipping on the last three items listed; and I'll be glad
to answer any questions I can about any of the above.

Gary Anderson

3161. Re: Boston Computer Society shows Falcon 030

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 19:07:28 UTC
From: peters@allvax.enet.dec.com
Message-ID: <9209251907.AA29024@enet-gw.pa.dec.com>
Source record: 217176

Steven Selick did an excellent job of reporting on the introduction of the Falcon 030 at the recent meeting of the Boston Computer Society. I was also there, and have a few additional comments.

- there were about 125 in attendance in the hall

- there was one Falcon in the lobby demoing a MIDI application. The fellow using it said he was from Dr. T, and just got the machine two days ago. It had 4 meg.

- there were 3 Falcons near the front stage. All looked like production machines.

- the term "personal integrated media" was mentioned several times, and will probably be used many times in the future by Atari

- speedwise, the Falcon is equivalent to a 25-30Mhz 386 machine

- a 19.2K bps modem is now being implemented for the Falcon

- with a box, the Falcon will be able to do CD photo applications (nothing on who will make the box or what will be in it)

- one of the demos shown on the projection screen was a 20 channel equalizer. Bill Rehbock was adjusting the channels in real time so the adjustment effect could be heard.

- the two games to come bundled with the Falcon, Land Mines and Breakout, will utilize true color mode

- voice mail (from a NeXT programmer) and video phone applications "are coming"

- James Grunke mentioned that after spending $400 on a monitor and $800 for an adapter, one could use all 8 stereo channels at once, making the cost about $300 per channel. (assumes a $1300 Falcon)

- why only 16 bits for true color? They felt 16 bits was sufficient and challenged anyone to see the difference between it and 24 bits in real world images

- Atari will "definitely" have a US 800 number for user help (didn't say when though)

- a little box to interface the DSP to the phone line is being developed, and should be available by the first quarter of 93

- in many respects the Falcon is more powerful than the Video Toaster, containing 98% of its functionality. The cost of the Falcon plus

any associated software/hardware will be less in cost than the Video Toaster itself.

- a 1 Meg Falcon is a viable system, since the operating system takes only a small amount of RAM (from Bill Rehbock) (he didn't say how much, but I believe he did use the word "miniscule".

- 386DX and 386SX boards are now being worked on in Germany (I think he said 486 also)

- the Spectre board will fit within the Falcon, for those who are worried about the lack of an external drive

- the Falcon docs, with DSP info, are available to anyone for $80 - just send the check to Atari

- the Motorola DSP assembler and linker is being shipped to Falcon developers

- video recording will be possible with external hardware (they said it would have taken too much extra hardware to include direct video input on the Falcon)

- the audience was generally passive during the presentation, but the Tina Turner video was so impressive that it got a round of applause (no, you can't get it - its heavily copyrighted we were told)

- Bill Rehbock, one of Atari's Falcon technical experts, mentioned to me that he has a Compuserve account and generally manages to answer his mail every nite

At the end of the formal presentation, everyone gathered near the front stage to see the 3 Falcons doing a slide show in true color. One monitor, an Atari 1435, looked especially good. One slide of a baby surrounded by stuffed animals looked so good I was tempted to reach out and touch the fuzz!

In summary, yes I was impressed, and I plan to buy one when they are generally available (a developer friend of mine already has his order in).

And no, I didn't win the Falcon door prize either (sigh...)

3162. Re: CAD programs

>
>OrCAD for the PC is relatively unique. I don't think there is anything
>comparable available even for the Macintosh, not to mention the Atari ST.
>

There is a very good CADD prog for the mac that doesn't cost $>1000...
it is called Claris CAD (by ofcourse Claris)... we use it at work for
all our enclosure layouts, our machine shop uses it for every print/
patent applic that they do... it is very intuitive, easy, and powerful.
we've tried autoCAD (and another which I really don't remember (it was
that awful)) and felt that it wasn't worth $150 let alone $3500...

I haven't tried to many CADD progs for the st... thought I do own a
copy of the old "firstCADD" by generic software... their new product,
genericCADD, _looks_ pretty nice -> IN THEIR ADDS, if have no idea how it
is in actual use... I wouldn't bother with their firstCADD, since I am
under the impression that it was one of their attempts at CADD software.

hope this helps.... -dean

3163. Accessing the system timer?????

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 19:53:17 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1992Sep25.125319.3752@arizona.edu>
Source record: 217179

I asked this before and didn't get too much in the way of responces, so here goes again:

I basically want to know how to get a timer value with better than 2-sec accuracey using Prospero Fortran. From GFA Basic, the TIMER variable gives a 1/200 reading of the system clock, but I can't find where it gets this. The GFA manual says BIOS(6) has this value, but it always returns 20. Anyone know where I could find this time?

-Thanks

-Paul Harris
paul@jupiter.ame.arizona.edu

3164. Where's Spectre 3.1???

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 20:02:25 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1992Sep25.130227.3753@arizona.edu>
Source record: 217180

Okay, another question (or a couple, actually):

Does anybody (e.g., Dave Small--are you out there?) know when (and if :( )
Spectre 3.1 will be comming out? It's sure been rumored for a very long,
long time.

The reason I want to know is because I'm trying to decied whether to get
some TT-RAM (which Spectre 3.0 can't use--but 3.1 supposedly can) or just
to get a 2M ST-RAM board, which Spectre supposedly can use now (as if I
can afford either).

On a similar subject, I've read that various things can't use TT-RAM, like
the DMA port. So if I got some TT-RAM, would there be problems accessing
my hard drive (which is conneced to the DMA, again for the sake of Spectre--
oh where's 3.1??)? And if I were ever to get a laser printer, would it have
trouble with only 2M of ST-RAM that I now have (but then, now I'm dreaming...)?

Help!! -Thanks.

-Paul Harris

|> * Christchurch, New Zealand | SLNET: 250:700/1266 FIDONET: 3:770/180 *

From Atari's presentation to the Boston Computer Society last night, it was pretty clear that having the DSP act as a modem will be not only possible but a selling point for the Falcon. From what was said, it appears that all is needed is a small adapter from a standard telephone jack to the DSP's input port plus the right software and you have yourself a 19.2kbaud modem. This makes sense since a modem just processes signals in a very specific manner and the DSP is just a powerful processor which happens to be able to do some operations more then others. So, with an adapter costing far less then a comparable modem would cost, you can have your Motorola 56k do all the work of a highspeed modem with error correction and data compression. When new data compression standards come out and superceed the current crop of V32bis and MNP 5 standards for compression/correction, all you need to do is load new software.

The problems with taking a phone on and off hook would be handled by the adapter box, which shouldn't be much of a problem.

3166. MDemo IV!

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 21:08:55 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.717455335@cwis>
Source record: 217178

I just downloaded MDemo IV from the atari archive and I am VERY impressed by the amount of work that went into making the music for this demo. Damn that guy is good. In the resetdemo, he mentions an address you can send a letter to in order to get .mod's. Does anyone know a ftp site where I can get the mods to these demos? BTW, where can I find Mdemo 1 and 2?

3167. Atari Falcon at BCS Show - Eyewitness Report!

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 21:48:10 UTC
From: markjl@acs.bu.edu
Message-ID: <96799@bu.edu>
Source record: 217183

Wednesday, September 23rd, 1992.

BOSTON--Atari Corporation debutted its Falcon 030 to the American public at the Boston Computer Society's general meeting in the New England Hall. Over two-hundred members filed into the hall, where a large, fifteen foot videoscreen projected Falcon 030 GENLocked video directly, audio was directly output to the hall's amplified system. Three working Falcon's sat atop tables in front of the stage.

After initial opening and welcoming procedings with an award to visually impaired computing leaders, Mike Newhall, Director of the BCS Atari ST Users Group, introduced the Atari Corporation presentation. Sam Tramiel, President and CEO of Atari, began the presentation of the Falcon 030 by stating Atari's new goal of Personal Integrated Media for consumbers. He stated that Atari had gone through transitions and consolidation, and now was poised for growth.

He diagrammed a map of the market Atari is interested in, which looked like this:

```
+-------------------------+----------------------------------------+
|Personal Computers | Traditional Entertainment/Video Games|
| Apple|Nintendo,Sega |
|Business-----------------+-----------------------------------Home|
| Microsoft,IBM|Phillips,Cable TV,Sony |
|Multimedia | Interactive TV |
+-------------------------+----------------------------------------+
```

In the corners were market categories, each box had some companies that represented the market for examples (I've put in some I remember). Tramiel noted that a lot of the market categories were overlapping, and companies have begun to enter into new markets. Tramiel outlines a lot of statistics showing market penetration of television, CD players, personal computers, etc. into American households. Now the industry can provide computers that can handle current consumer audio and video, Atari wants to deliver a full functioned computer for a reasonable price. Atari wants to tap the market with the Falcon series of computers, which exceed stereo CD audio quality capabilities, which come fully equiped (just open the box and plug it in), have an existing software base (the entire Atari ST/TT series library), and which are priced well (the Falcon 030 costs the same amount of money as all the video/audio augmented hardware add ons required on personal computer other platforms alone).

Richard Miller, Vice President of Research and Development was the next to speak. [I noted his British accent and asked him if he was from Atari UK when I spoke to him after the presentation. He came from Perihelion, which was involved in the Atari Transputer Workstation OS, and then did a brief

stint at Atari UK. By the way, he said the ATW is a dead project.] Mr. Miller led the development of the Falcon 030 system architechture, and he envisioned a computer that his mother could utilize. She didn't want a PC, or a Mac, she wanted a computer that could make tea, answer the telephone, turn on the lights, and mail her letters. Miller then stated that customers want the most sophisticated technology, highest quality, and lowest price. "You can never underestimate the consumer," Miller said, so the computer should be just as good as the consumer's CD player or television at audio and video, respectively. With a CD player as low as $100, a color television as low as $200, and a FAX machine as low as $200, etc., consumers want the same performance and combined price for a computer that can do all of these things.

The Falcon 030 achieves this for consumers with its power at a low price. The Falcon's power comes from its distributed processor architecture:
- CPU: Motorola 68030 (32 MHz) central processor unit
- GPU: Blitter graphics co-processor (16 MHz): 64 million pixel per second
- DMA: DMA engine: fast memory access to/from SCSI, audio, peripherals, etc.
- DSP: Motorola 56001 (32 MHz/16 MIPS) Digital Signal Processor unit
Optionally available is the:
- FPU: Motorola 68881/2 Floating Point mathematic co-processor unit
- 3rd party: 286/386SX CPU for IBM PC emulation
Atarians are used to the CPU/GPU/DMA from the ST/TT series computers. The new Blitter has some new functions and runs at twice the speed of the STE Blitter. Chip sockets for the optional processors are on the Falcon 030, I believe. SACK (of Germany) is working on the 286/386SX emulation now.

The digital signal processor (DSP) performs functions entirely in the digital domain, providing an answer to analog signal processing's problems. Immediate applications of DSP are audio processing: sixteen band graphic equalization, echo, reverb, chorus, flange, compression, distortion, surround sound, pitch shifting, synthesis of sound/music, speech generation and speech recognition. [Most exist already on the Falcon, Atari is working hard on the speech recognition, according to Tramiel.] DSP also loans itself to these areas: array processing, optical character recognition, video compression and decompression, etc. Atari will utilize the DSP's high performace mode to create a virtual 19.2Kbaud modem and a virtual 9600 baud full-duplex FAX. Future Atari Falcon applications include an all digital telephone answering machine and voice-mail for the home. [These too, are being worked upon by Atari, developers, and other 3rd parties.]

The video section of the Falcon 030 is capable of:
VESA video output at 72Hz, 640 by 480 pixels, Genlock, digital Chromakey, video overlay, PAL and NTSC broadcast signals, 1/2/4/8-bit graphics, and overscan. [Sorry, he went quickly there, and I'm not 100% sure of all of the definitions of some of the features.] These video capabilities loan themselves to these applications: television picture in picture, video effects, CD Photos (just add a CD ROM player).

The audio section of the Falcon 030 is capable of:
16-bit digital audio at 50kHz, eight-track digital recording and playback, stereo 16-bit CODEC, an input for an external microphone, and a headphone

output jack.

The Falcon 030 also has the following output ports: stereo audio out, SCSI II port, DMA port, DSP port, MIDI IN/OUT ports, LocalTalk LAN port, RS-232-C port, and two enhanced joystick ports (for lightguns, etc.). The Falcon 030 contains MultTOS operating system in a four meg ROM and is available with 1, 4, or 14 megabytes of RAM.

Bill Reincock, Director of Application Software, showed the audience bundled software with every Falcon 030. He stated that the Falcon 030 has been in developers hands since May 1992. Some of the things that the Falcon 030 can do is address the needs of the consumer who wants to create video and audio, as evidence he cited "America's Funniest Home Videos" and the popularity of the camcorder. The Falcon 030 loans itself to home video titling, video presentations for business or education, etc.

The first piece of software demonstrated was Falcon D2D, a basic audio sampler and waveform editor which can sample directly to the hard drive for recording. Sample waveforms may be loaded and graphically edited, spliced, etc. Then waveforms may be arranged into a small cue list sequencer for flexible playback.

The second piece of software was the Audio Fun Machine, basically a digital audio effects processor. There were two, full color equalizers (one for left and right input each) which were adjustible filters manipulated with the mouse. Using the external microphone input, you can apply the 10 band EQ filters in realtime as well as add the following effects: "surround sound" ambience, concert hall reverberation, phase shifting, distortion, etc. You can also edit the effects waveforms.

The third piece of software demonstrated was the System Audio Manager, where one can assign sounds/samples to system events, each function key, and any key on the keyboard. The sounds play without any system slowdown, you can use Atari samples from the D2D program or import Microsoft Windows *.WAV files and Mac sounds.

Additional bundled software mentioned: CALAPT - a calendar and appoint ment scheduler program [a la Portfolio, I imagine], ProCalc - a full-featured scientific calculator, Talking Clock - displays time and announces the time at user set intervals, and two games: Landmines and Breakout.

The Falcon 030 can output to the VCR directly the user's own 3-D animations (via Lexicor software, etc.), titles, etc. to create home videos. "The Falcon 030 is the only 16-bit true color computer in its class," said Reincock. With a low cost telephone line interface (on the way, 1st quarter 1993, by a Scottish company: it'll be the size of a cigarette box and it will have international telephone ports on it, according to Tramiel) this can lead to FAXing and low-cost videophones through the Falcon 030.

The Falcon 030 uses the GEM desktop, based on Digital Research's DRI GEM, for its graphical user interface. The icons are now animated and color, the desktop is customizable. [From what I saw, animated means this: when you select an icon, it does not reverse itself to show it is highlighted,

it changes to a new icon. Eg: the trashcan opens, the file folder has a file pop up, the disk opens its shutter, etc.] With the OS in ROM, there is no possibility for virus corruption of the OS or wait for the entire OS to boot off of the hard drive.

MultiTOS is preemptive multitasking with adaptive prioritization, so as to make the current user process appear to have no slow down. It is compatible with existing software [as long as they didn't use illegal OS tricks!], it allows for messages and pipes: this yeilds interprocess communication. It uses a hierarchical file system with loadable drivers for compatiblility with UNIX/Mac devices, the forthcoming Atari CR-ROM player, etc. MultiTOS will have other disk extensions for future expansion.

James Grunke, Director of International Music Marketing, was the last to speak at the presentation. He outlined this period as historic for music and Atari:

1985 - Atari Corporation was the first to realize the potential of MIDI and placed MIDI IN/OUT ports on their ST series of computers.
1986 - Atari was the computer company to market directly to musicians, it places an advertisment in Keyboard magazine.
1987 - Atari was the first computer company to attend the NAMM convention. (NAMM = National Association of Music Merchants, I belive.)

Atari computers were also the first to directly synchronize to SMPTE time code. Today, Atari still holds fifteen percent share of the music market. The OS has rock solid timing, essential for music and MIDI sequencing. With features like stereo CD audio, the DSP Motorola 56001 chip, the SCSI II port for access to samplers/hard drives, and true color video, the Falcon 030 has standards that musicians want. The Atari ST/TT series of computers also has a mature music software base.

Where a Max IIci with 5 Mbyte RAM (street pricing) plus software ($1000) costs $2500 per stereo track, the Falcon 030 4/65 with 4 Mbyte RAM and 65 Mbyte hard drive at full list price ($1299) costs $849 per stereo track. With an additional hardware expansion to bring system capabilities up to eight stereo tracks, which includes XLR inputs plus DAC and clock chips, the Atari system comes to $1699 + $800 HW expansion: it costs $312 per stereo track.

The demonstration concluded with a summary of specifications, pricing, and availability: dealers will recieve a demonstration Falcon in November, but the real production rollout of Falcon 030's will be in January, 1993. Atari will begin a regional rollout, when that is completed national advertising shall follow. Sam Tramiel said that back in 1987, Atari sold 10,000 units a month and ran into the Japan/US dynamic RAM troubles. Atari never came back in the US market, it developed and expanded the European market since then, but now Atari wants to come back into the US market with the Falcon 030.

A question and answer session followed: the LAN port is Localtalk, which is hardware identical to AppleTalk, it is not ETHERNET, but that will proabably be addressed by 3rd party developers. DVI boards are currently being worked on by 3rd party developers, hopefully under $500.00. ASEUB

digital interfaces can be done: a chip for digital bandwidth offload may be necessary in an external interface. Video overlay is accomplished with a 3rd party GENlock device, it can be controlled down to the pixel. The DSP port will be able to access external analog to digital chips, the port can support one megabyte per second data rates.

Atari readied a demonstration of the Falcon 030's video capabilities. Approximately 2-3 minutes of a music video had been sampled into the Atari and saved to the hard drive previously. The Falcon 030 was able to pull off the 92 megabytes of video data off of the hard drive and display the video as 24 frames per second in full screen, true-color mode with CD stereo audio IN REAL TIME. This elicited quite an applause from the audience. There was no compression involved, performance was based solely on the Blitter and 030 processors.

When asked about the reason for Atari's choice of 16-bit true color as opposed to 24-bit color, the response was that the eye can see about one million colors, and 24-bit allows 16 million colors: the 16-bit color was a good compromise for the real world and brought Falcon expense down without cost to performance. MS-DOS 3.5" floppy file compatibility was confirmed. When asked about Falcon developers, Atari reported that there had been an overwhelming response from old ST developers who were coming back to Atari, interestingly, a lot of NeXT developers are coming over as well. Some Amiga developers claimed they'd rather develop on the Falcon 030 than the A4000 platform. Atari said they'd like to get into universities, but would have to come in through the "back door" with Desktop Video and Desktop Radio and music applications.

Inexpensive third party frame grabber and scanners are coming. The Falcon is Logitech Fotoman compatible. Atari envisions the Falcon to have 98% of the Video Toaster capabilities soon, and for significantly less than the Video Toaster alone. You will be able to use multisync VGA monitors on the Falcon, but make sure that they can "go down" to NTSC broadcast specifications for true-color modes. MultiTOS will be partially disk based for extensions, the OS is a 4 Mbyte ROM containing all of the languages/keyboard layouts to further enhance compatiblitity throughout the world for developers.

The 1040ST style case was used for production expediency, it's a darker grey/light brown color with dark grey keys. But Sam Tramiel said this was the "beginning of exciting, different machines... more birds" in the Falcon series. [New Atari computers will be named after birds, videogame consoles after cats. Eg: Lynx, Jaguar (which probably will be based on the Falcon and have all of its resolution modes, plus some peripheral compatibility, ie: joysticks, lightpens, Atari CD-ROM, etc).] Atari was asked about customer support and service for the hardware: Atari is working to re-establish old dealers and will have a 1-800 toll free number.

When pressed about Falcon 040s, the audience was told "before you see 486's emulated on the Falcon 030." The Q&A session ended here, and Atari gave away a door prize: a Falcon 030!

I followed up to Sam Tramiel and asked him a few things, Atari is talking to Kodak about Photo CD development, Phillips wants development of an Atari Falcon of a CD-I card (but no mention was made of who would do these things). Atari is working on an inexpensive CD-ROM player, connected via the DMA or DSP port as opposed to SCSI II.

[This concludes my report, but I have another report based on the BCS Atari ST user group's visit by Bob Brodie and Bill Rehbock with two Falcons the next day. It's coming! I tried to keep this article in a formal style, but I dropped out of it towards the end. I hope you appreciate my efforts, I'm sure 99% of the information is correct, as I heard it, and have pointed out places where I wasn't sure of things, so this should be a legitimate guide for you learn about the Falcon.]

3168. How to view a GEM metafile

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 22:02:54 UTC
From: selbyr@meena.cc.uregina.ca
Message-ID: <25SEP92.22025470@meena.cc.uregina.ca>
Source record: 217197

So, know I know what the GEM metafile is, but how do I see the graphis?
Is there a small pd program that will allow me to view the graphics easily?

3169. Falcon at BCS Atari ST user group meeting!

Newsgroup: comp.sys.atari.st
Date: 1992-09-25 23:06:32 UTC
From: markjl@acs.bu.edu
Message-ID: <96810@bu.edu>
Source record: 217185

Thursday, September 24, 1992.

CAMBRIDGE--The Boston Computer Society's Atari ST User Group followed
up to the previous day's American introduction of the Atari Falcon 030 computer
with a visit from Bob Brodie, Director of Communications, and Bill Rehbock,
Director of Applications Software, of Atari Corporation. They were in the
company of two Falcon 030's, much to the delight of the user group.

Basic specifications and configurations were covered as follows:

Configurations: Atari Falcon 030 - (1 meg RAM, no hard drive) = $799.
Falcon 4/65 (4 meg RAM, 65 meg hard drive) = $1299.
Also available: (14 meg RAM, (65 meg HD?)) = ???.

Processors: M68030 (16 MHz CPU), M56001 (32 MHz DSP), Blitter (16 MHz GPU),
and DMA.

DSP specs: M56001 (16 MIPS or ~ 96 MOPS = Millions of operations per second).

26 pin __________[8-bit bus for instructions]
DSP Serial Port /
--------------=>[Motorola 56K DSP Chip]----------=>(SSI out)
(SSI in) \
_[RAM] 32kWords, 25 nanoseconds.
2
More about the DSP port: a Sony/Phillips I S port (sound DMA)
CODAC coder (digital to analog (DAC) and vice-versa). One mega-
byte per second IN and OUT simultaneously, this allows for expan-
sion of stereo inputs for digital sampling or additonal MIDI
ports, etc.

Video: True 16-bit color = 65,000 colors, VGA graphics.
Video to older ST monitors (eg: SC1224) with adapter inteface (coming),
Output: to newer ST and TT monitors, to NTSC televisions, and
to VGA monitors.

Upgrades: Dealers will be able to upgrade a 1 Mbyte Falcon 030 to 4 or 14
MBytes with a board from Atari (coming).
The 2.5" IDE hard drive can be replaced easily (for repair/upgrade).

Compatible: Falcon 030 is more compatible with Atari ST software than the
Atari TT because it has a Blitter. All 14 Mbytes of RAM are unified
memory to the video and cpu via MAB bus: thus no TT/ST RAM segments.

Bus specs: (as best as I can recall!)
COMBEL / GLUE / Blitter (chips for memory functions) - 32 bits wide.
VEL (Video chip) via MAB bus - 32/16 bits wide. (All memory can

be thought of as a huge video buffer or memory can be accessed
as video and instructions at the same time, I believe.)
DMA (handles SCSI II ports, Audio, etc.) chip bus - 16 bits wide.
M68030 CPU - 16 bits.

TT Has TT RAM burst mode, can execute programs twice as fast due to
advantages: its 32MHz M68030. Larger chassis accomidates for expandible VME
cards, etc. 3.5" Hard Drive can be easily replaced/upgraded, it
has better potential capacity the the Falcon 030 2.5" HD.

Falcon Finally has a fan in there! Cheaper than TT. Has STE enhanced
advantages: 15-pin joystick ports (accepts lightpens) has two pins for analog
signals? (Mistakenly left off of the Mega-STEs and TTs.)

Localtalk: LAN is 100% hardware compatible with AppleTalk LAN (but s/w protocol
has to follow to use it!).

HD Yes, they are unlimited on the Falcon. New Atari HDX tools are
Partitions: coming for the Falcon.

Genlocking: 3rd party GENlock devices exist (Atari used the JRI device). In
order to do desktop video overlaying, here's the hardware hack:

```
---=> RGB ]
Atari--[OUT]---=> Composite ]----------=>[Genlock] [Video ]
Video ---=> Overlay bit ] [ Box ]<=---Video-------[Source or]
Signal--[IN]<=--- Vertical Sync ]<=----[ ]<=---Dot Clock---[Camcorder]
<=--- External Dot Clock] /
[to Monitor]
```

The Genlock Box contains an Analog Multiplexer and Raster Scale Chips. The
Atari just "paints" an area in "overlay bit" color, which the Genlock box
recognizes and uses the external dot clock to sync the video signal to that
overlay area via the multiplexer which can set each pixel (raster) on the screen.
Thus, the Genlock just patches in the video signal onto the Atari signal and
then outputs it to the monitor. Some more work (and chips) are needed, so the
image can be scaled and moved around, requiring some more I/O from the Atari to
the Genlock box for true scalable, movable pictures in a GEM window.

On the way stuff:

SLM804 and Third party companies are already working on DMA to SCSI link to use
SLM605: the Atari Laser Printers, so Atari has left them to do it. German
3rd party company is working on adding buffer RAM into SLM804 inter-
face for extra performance.

Atari UNIX: is completed, but 030 performance was slow. When it comes on the
030 it will be text-based only. They are waiting for 040 to have
a full blown windowed Atari UNIX.

FSM-GDOS: It is really coming!! (November, hopefully.) Atari worked with QMS
originally, but that didn't turn out well. So, Atari approached
Bitstream. The new Bitstream Speedo scaler is faster than QMS's
scaler, will work with Post Script Type I and Bitstream fonts.

Bitstream fonts are plentiful (800+) and available (like Egghead
S/W) in IBM-PC 3.5" floppy format, which can be read by any Atari
floppy drive. Bitstream is updating their font packaging to say
Atari compatible.

SUTRA: (Working title only!) An Atari multipurpose application, much like
Lotus Works: it has a database, wordprocessor, spreadsheet, etc.

Spectre: Dave Small has his Falcon 030, he's tinkering!

Frame Matrix Frame (from a third party in Germany) has achieved eight
Grabbing: frames per second through the cartridge port, a nice hack. This
area will be refined and improved now that the Falcon exists.
Touchscreen:Already exists on the ST, should be further developed on Falcon.

[Aok, that's a summary of everything that happened. Forgive me for any errors,
especially the misspelling of Bill Rehbock on the previous BCS General Meeting
report where Atari debutted the Falcon 030 to the public -- I didn't run the

The RAM boards for the Falcon will not need any extra logic, only the RAM.

> - a 1 Meg Falcon is a viable system, since the operating system takes
> only a small amount of RAM (from Bill Rehbock) (he didn't say how
> much, but I believe he did use the word "miniscule".

Well, 320x240x256 colors = ~80K
And you could use twice (or even fout times) as much memory.
And I don't think the TOS4 with eat less the current one.
So that 1Meg will definitely be tiny. At least as tiny as on a
ST. Of course the problem is not the same for games: the user
just don't care and only 1 prg stays in memory. (although
programmers may wish to be able to use 2M memory without
losing too much of the market...)

Stefan Monnier

3172. Re: Accessing the system timer?????

In article <1992Sep25.125319.3752@arizona.edu>, paul@jupiter.ame.arizona.edu (Paul Harris) writes:

> I basically want to know how to get a timer value with better than 2-sec
> accuracey using Prospero Fortran. From GFA Basic, the TIMER variable gives
> a 1/200 reading of the system clock, but I can't find where it gets this.
> The GFA manual says BIOS(6) has this value, but it always returns 20.
> Anyone know where I could find this time?

The 200Hz system-timer is a longword at $4BA. As $4BA is in the
system-RAM, you'll have to be in supervisor-mode to read it.

3173. GNU dbm 1.5 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-09-26 02:54:04 UTC
From: rosenkra@convex.com
Message-ID: <1992Sep26.025404.18668@convex.com>
Source record: 217194

i ported and uploaded v1.5 of GNU dbm to atari.archive (in new dir for now). dbm is a database library for unix. this version incorporates dbm, ndbm, and GNU's own gdbm. note that there may be data conversions needed for bringing existing unix dbm databases to this system (even if gdbm is run under unix). a conversion prog is included. orig src + .olb are in the archive. mostly untested so use at your own risk. there are test progs included.

file is: ~ftp/atar/new/gdbm15.zoo

enjoy...

3176. Wanted: Empire, and others

Newsgroup: comp.sys.atari.st
Date: 1992-09-26 09:04:14 UTC
From: Devon_Sheppard@mindlink.bc.ca
Message-ID: <300@mindlink.bc.ca>
Source record: 217051

I'm trying to find someone with a copy of Empire for the ST. I'll buy for cash, or trade other original software.

I'm also looking for a game called Quadralien by Logotron. If you've got an original of either of these and you want to get rid of it, send me some mail. Thanks.

Devon

Yeah, right. Running in what screen mode? Not when in 16-bit mode I'm
sure. BTW, does anyone have a table saying how much the Falcon slows
down in the various video modes? That would be interesting reading
indeed.

> - a 19.2K bps modem is now being implemented for the Falcon
^^^^^
What standard? There is no 19.2Kbps standard yet! It may be good
for connecting two Falcons but no more.

You got to be kidding! Whoever said that should get a clue. There's no
way a puny little Falcon can pull off the tricks the Toaster can. Wake
up and get a grip on reality.

Hello There, I have gotten AN Cool M demo 3 a couple of months back , I was impressed too, I never got to see a Reset Demo though. Hmmm Maybe it's for ST's only not STE's... Well if you are looking for the .MODs, I have them in the TCB Tracker format, and also I spent a couple of hours converting them all except the 'Being a Carebear takes a lot of skill', (I can't rip that one), they sound quite nice, but the only bad thing is the first 15 seconds of some of them, they are kind of gimpy...

Leave me mail if you need more info..

Oh great, we now not only having a rogue Amiga users come and try to
start flame wars, but now we got Nintendo people coming.

Well, anyway, a Super Famicon (Super Nintendo) has only a 65816 in
it, not a 68030, and the sound is lower quality (much lower) than a
Falcon, Graphics are lower quality, etc...

This is a very meaningless topic for discussion, and I suggest it
be dropped.

From what I understand, not difficult at all. All you need is an adapter from the DSP port to the RJ11 plug on the phone line. I've heard people talking about $100 for that. A 9600 baud modem for $100? Very cool...

> ||| Ed Krimen
> ||| ekrimen@wet.com
> / | \ E.KRIMEN (GEnie)

The problem is that the Dataformer will be quite expensive.

The CVD and CVG file format have not been made public. However, I have asked Bob Elbracht (sp?) of DMC (Holland) about the file format of these programs, and he told me that in principle they are prepared to provide a description of the file format, provided that I sign a non-disclosure contract for it. Both the disclosure and the non-disclosure contract are to prevent 'mutant' versions of the file format through reverse-engineering or incorrect interpretation of the file description.

However, at the moment DMC is updating the documentation about the file format, so if you really want to know, wait until november.

If they will be as nice to you as they were to me if you tell them you want to generate Postscript is another matter. They have been quite childish about Postscript and Postscript fonts.

3191. 1.4 meg floppy on an ST?

Newsgroup: comp.sys.atari.st
Date: 1992-09-26 19:54:13 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Sep26.155413.28048@newstand.syr.edu>
Source record: 217067

Alright, here's something I don't think I've ever seen discussed before.

I'd like to have a high density drive for my ST (i.e. 1.4 meg floppy). To tell the truth, I'm not even sure if my ST could be adapted to work with a high density drive, or whether this is a possibility only for STes and TTs. Nevertheless, rather than trying to do something internal, could I simply buy a SCSI-high density drive made for the Mac?

Here's my idea. I've got an ICD Fast hard drive. Right now I've got a Cutting Edge 44meg Syquest Removable plugged into the SCSI port of the ICD drive. This SCSI drive unit was made for the Mac world, but works fine in ST mode as well as in Spectre mode (it works in msdos mode, too...via ATSpeed). Anyway, what if I were to buy something like the Infinity Turbo Floppy 1.4 (currently $289 from MacWarehouse) and chain it off of my Syquest? I imagine it would work in Spectre mode, but doesn anybody have any idea if it would work in ST mode (or msdos mode via ATSpeed)? If so, I think it would be a pretty resonable solution for high-density floppies!

--Gerry
ggreenbe@rodan.acs.syr.edu
PS. According to the salesperson I spoke to, the drive will not read 400 or 800K Mac floppies. But, who knows, maybe it will read 800K non-Mac floppies...?

9600/14.4 w/ compression. are you dumb or just acting like it?
if you're going to find something wrong with the Falcon (and i'm
sure there are a few things) you'll have to try harder than this...

> > - voice mail (from a NeXT programmer) and video phone
> > applications "are coming"
>
> ... Next century?

dunno, do ya? your unfounded accusations don't make the Falcon any
less of a powerful machine.

> > - in many respects the Falcon is more powerful than the Video
> > Toaster, containing 98% of its functionality. The cost of the
> > Falcon plus any associated software/hardware will be less in
> > cost than the Video Toaster itself.
>
> You got to be kidding! Whoever said that should get a clue.
> There's no way a puny little Falcon can pull off the tricks the
> Toaster can. Wake up and get a grip on reality.

and why not? you keep ask for "facts" about the Falcon, yet don't offer
any in return. why shouldn't it be able to do the same stuff the
Toaster does? everyone's pretty much admitted that the Toaster's magic
lies in the software. if the Falcon provides most of the same hardware
there's -nothing- keeping it from having software that does the
same stuff the Toaster does.

jeezus. if this is the way Amiga owners are supposed to act i'm selling
mine. what an ass.

3196. GCR troubles

Newsgroup: comp.sys.atari.st
Date: 1992-09-26 22:32:54 UTC
From: pinelr@aix.rpi.edu
Message-ID: <mhgzrqd@rpi.edu>
Source record: 217060

Hi, I just recently purchased Spectre GCR with rev 3.0 software from another user. I'm having problems getting started though...

a.) Everything is hooked up properly, the ROMS are Ok, the cables are secure, I reseated things, blah blah blah...

b.) I am using System/Finder 6.0.5 in native Mac format

c.) I am always greeted with a disk/question mark icon despite the fact that a valid disk is in there.

d.) I hit F1, it rereads the disk, and the happy Mac comes up.

e.) I get "Welcome to Macintosh"

f.) I get a crash page, with an "Illegal instruction trap" error or some such nonsense. Any attempt to restart the finder will just result in more crashes and an eventual freeze of my machine.

I am using this on a Mega 2 with TOS 1.4. Is there anything I'm missing here or do I just have terrible luck with emulators???

Help me please!!!!!

3198. Mainframe transfers

Newsgroup: comp.sys.atari.st
Date: 1992-09-26 23:20:14 UTC
From: selbyr@meena.cc.uregina.ca
Message-ID: <26SEP92.23201498@meena.cc.uregina.ca>
Source record: 216973

Are there any half decent easy to use transfer protocals available
to make transfering files between a mainframe like an IBM 4381-12 and
an ST faster than kermit - I mean software for the mainframe. For
a VAX 8600? I'm thinking perhaps a version of zmodem, or even just
xmodem.

3199. Re: Boston Computer Society shows Falcon 030

I'm sorry if this has been covered before, but I haven't read this
group until now. I still don't understand how the graphics chips
can possibly fetch 30MB/sec (I assume the above mode is 60Hz and
non-interlaced) without slowing the 68030 down one bit... I've been
told that the Falcon graphics chips live on the main processor bus so
that just don't make any sense at all!

Maybe it's just more of that Sam Tramiel magic :-)

>> > - a 19.2K bps modem is now being implemented for the Falcon
>> ^^^^^
>> What standard? There is no 19.2Kbps standard yet! It may be good
>> for connecting two Falcons but no more.

>9600/14.4 w/ compression. are you dumb or just acting like it?
>if you're going to find something wrong with the Falcon (and i'm
>sure there are a few things) you'll have to try harder than this...

But that's hardly what you would call a 19200 bps modem. If it
implements V32bis it's 14400 bps, and if it's V32 it's 9600 bps,
but there is no 19200 bps standard that I know of yet. V42"
compression doesn't increase the transfer rate modem<->modem.

So again: Which standard is it?

>> You got to be kidding! Whoever said that should get a clue.
>> There's no way a puny little Falcon can pull off the tricks the
>> Toaster can. Wake up and get a grip on reality.

>and why not? you keep ask for "facts" about the Falcon, yet don't offer
>any in return. why shouldn't it be able to do the same stuff the
>Toaster does? everyone's pretty much admitted that the Toaster's magic
>lies in the software.

If that is the case, why is it that no-one has produced the required
hardware and software for the Atari ST? The hardware is simple you say,
so why not? And why isn't there an equivalent for PCs or MACs ? If it
was easy someone would have made the Toaster for PC-machines long ago
and be multi-millionaires by now. No, the secret lies in the combination
CBM Video Hardware + Toaster HW + Toaster SW + CBM System Software.

>if the Falcon provides most of the same hardware
>there's -nothing- keeping it from having software that does the
>same stuff the Toaster does.

Can you be a little more specific? What hardware components in the
Falcon replaces the Toaster? Does it output 24-bit video? Does it
have video inputs? Can it mix video signals? Can it produce
broadcast quality output? Does it have ASICs to create custom
dissolves/wipes etc? Character generators? Chroma keying?

>jeezus. if this is the way Amiga owners are supposed to act i'm selling
>mine. what an ass.

I'm just giving you my view of the Falcon. Sorry if it doesn't fit
in with yours. If you think I'm an ass, then I can show you some pretty
ridiculous posts from Falcon fanatics in comp.sys.amiga.advocacy ...

>jason "an amy person who knows a good computer when he sees it" steiner

And I know a crippled & over-hyped system when I see one. I think
Falcon is one of them (right up there with the Mac IILC and family).

Good luck with your Falcon!

3201. problems with EPSJET.PRG (Epson Emulator for Deskjet 500)

Newsgroup: comp.sys.atari.st
Date: 1992-09-27 00:42:41 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <7090@tekig7.PEN.TEK.COM>
Source record: 216951

In the hputils.arc file on terminator, I found this wonderful program that *almost* works. It takes over one of the trap vectors, and when Epson printer codes are sent to it, it figures out what to send to a deskjet 500. I'm trying to use my old PrintMaster Plus program, which has an Epson driver, but no HP driver. It prints Epson graphics on the Deskjet 500, but there's a blank line in between each line of graphics. I experimented with the HP DIP switches and the Printmaster CR/LF options, but that didn't help. Perhaps the problem is that the emulator is for an MX-80 and Printmaster expects an FX-80?

The author of the emulator is David L. Baily. Is he on the net?

Thanks for any help.

Pinhead is shareware; it's bound to be on atari.archive. Try to get v2.1,
which works on all TOS versions. Mail me if you have a problem.
MaxiFile _is_ commercial, from the Codeheads; sorry I don't have their
address at hand.

>machines (same Gfx as A4000) by christmas.

I find that the most successful products in history were completely missed
by the press.

We shall see if this tradition continues...

As for Commodore, don't hold your breath...

Developers have had Falcons since May and there should be a number of software
titles available by December.

Very few Amiga developers (if any) have had the new "AA chip" machines.

There is no reason to feel loyalty towards Commodore. I've heard that
Management-Developer problems have been occuring.

No. You see, here in Scandinavia Atari doesn't even have a subsidiary ...
Commodore has four. Go figure ...

>The more I read, the more I see an insecure Commodore user that is letting
>out his frustrations on the comp.sys.atari.st newsgroup to make himself
>feel better.

Right :-) I am a registered Commercial Amiga Developer so I know what CBM
is up to and I know it's good, so I'm not one bit frustrated or insecure.
Quite the opposite, actually.

I just wanted to see how Atarians react to criticism, and so far I've
received no sensible reply (except one in EMail). I'd like you to answer
some of the questions I asked instead of just dismissing me as "one of
those stupid AmigaDroids". I was interested in the Falcon at one point but
quickly lost interest when I learned that the blitter and the rest of the
video hardware were on the main CPU bus... Talk about crippling a perfectly
good CPU.

>The only thing I have to say is that Atari released their next generation
>computer while Commodore has not.

Oh have they? From what I've heard you cannot go out and buy a Falcon
now because they aren't shipping yet! I can get an A4000 *now* and I'm
collecting my money to buy one...

Aaron,

I have Interlink ST (v1.85) and have always had problems with full screen editting under the VT100 mode. The screen doesn't update properly and I must always use ^L to refresh the screen. Are you using the original VT100 VT_100.EMU included with Interlink or an update? When ever I call the HP or VAX at TUNS I use Uniterm to avoid such problems.

Ken

>COULD have been for little or no additional expense on Atari's part...

Maybe they really are thinking of what it could be. My
understanding is that the memory expansion slot can be used for a host
of really neat things like VRAM and other neat video support (higher
res video, acceleration, etc.) in addition to ram expansion. Maybe
they should have put SIMM slots on the ram board like somebody else
will figure out how to do (and still fit). But I think that the idea
of a memory expansion slot that has extra possibilities over plain ram
expansion is a good idea.

: > sure. BTW, does anyone have a table saying how much the Falcon slows
: > down in the various video modes? That would be interesting reading
: > indeed.
:
: it's already been discussed. and the bus is fast enough to handle
: 640X400X16bits -without- slowing the rest of the machine down.

If Falcon's bus is a 32 bit one a 640*480/8 bit mode (w/o interlace)
will eat all available bus time from CPU (with the exception of
horizontal and vertical blanks) - assuming that sounds also use the
same bus the CPU is slower further down by them if they're used. A
careful approximation of mine is that 68030 in Falcon runs at roughly
40-50% speed in the highest bandwidth modes (640*480/8 no interlace,
640*480/16 with interlace). Using overscan will further reduce the
speed of system. The lowest bandwidth modes affect the CPU speed, by
decreasing it by something like 20% or so, mostly because of the lack
of the ability to use burst mode of 68030.

: and why not? you keep ask for "facts" about the Falcon, yet don't offer
: any in return. why shouldn't it be able to do the same stuff the
: Toaster does? everyone's pretty much admitted that the Toaster's magic
: lies in the software. if the Falcon provides most of the same hardware

Only some of it lies in software - the toasterboard is full of custom
chips and ram which is responsible (together with the Amiga chips) for
the effects - the Amiga chips alone could not alone be responsible for
the effects.

: there's -nothing- keeping it from having software that does the
: same stuff the Toaster does.

Unfortunately it's not just the software, but also the hardware. The
first thing Falcon lacks is hi colour high resolution modes needed for
broadcast quality video (ie. 1280*400+overscan with enough colors).
Also the Falcon lacks the hardware to do the realtime effects Toaster
is able to do (no, nor the Atari blitter, nor the 56001 is even near
of being able to do the effects).

My good, how paranoid can you get. The DSP can most likely support,
through software and a simple interface, ANNY speed or protocol up to at
least the 64/128 Kbps speed of ISDN, and probably even higher speeds.

Better yet, spend $110 more for a Freedom Floptical from PMC and you can get 21megs on a floptical as well as 1.44meg and 720K support. The drive from PMC comes with the Link from ICD and is ready to run on the ST.

I don't believe that Spectre has 1.44meg drive support yet.

Also, I'm not familiar with the TurboFloppy from PLI, but if it doesn't have an eject button, you're going to need to have a paper clip around when you want to eject disks. :^) I don't think Spectre will actually eject the disks for you. Moreover, at Glendale, the guys at ICD used a software program to tell a Mac-based floptical to eject a disk from an ST. It was just a TOS program. I don't know if that program is available.

If it hasn't already been mentioned Lattice C (v 5.52) ahd support for
maths co-processors, auto detecting/software/or FPU options. Lattice C (tm)
is a Hisoft product.

Adam.

3219. TeXDraw - new developer sought

Newsgroup: comp.sys.atari.st
Date: 1992-09-27 18:26:56 UTC
From: kruel@wpcst1.phys-chemie.uni-wuerzburg.dbp.de
Message-ID: <H.ea.YRqtFRhAunQ@wpcst1.phys-chemie.uni-wuerzburg.dbp.de>
Source record: 217087

Dear netters,

the author of TeXDraw, Jens Pirnay, has stopped the development of his program since he has changed the system.

However, he would give away the sources (and may be the compiler also), if someone is willing to take over the project for further development.

The program is written in Megamax Modula-2. The last version is 1.86.3, available e.g. from rusmv1.rus.uni-stuttgart.de (129.69.1.12) in /soft/tex/machines/atari. A slightly newer version should be available through the Funbox in Regensburg (Fido: 2:246/124), including sources.

To those who don't know TeXDraw yet:
It's a fully GEM based, very powerful drawing tool which outputs (La)TeX-code, including the epic-specials, cs-specials etc.
It can also convert various graphics formats.

As is always, software is never ready, and there are still many things to be done.
TeXDraw has been shareware (DM 20.-) and at least I am willing to pay more for an improved version.

If there are interested programmers, they should contact the author himself:

Jens Pirnay,
Mail: jens.pirnay@rphs1.physik.uni-regensburg.de,
pirnay@vax1.rz.uni-regensburg.dbp.de
Fido: Jens Pirnay (2:246/124.5)
Maus: Jens Pirnay @ R

Regards,
Thomas.

ICD SCSI Hard Drive Interface w/clock (battery backed) for use with
Atari ST series computers. Hardly used, bought 8 months ago. Includes
software/DMA cable/SCSI cable. Will sell for $70, OBO.

I also have a 20Mb 1/4 height (very small) SCSI hard drive that I will
sell with the adapter for and additional $100, but not separately.

Shipping not included.

>head need to be cleaned? *sigh*

Rob, my guess is that your problems are due to disk drive interference (Dave Small calls it "feedback"). This problem is particularly common on MegaST units evidently. If you have an external drive, try booting the Apple system disk from that drive. I know some folks have tried shielding their drive mechs by wrapping them in foil and all sorts of other tricks but to what effect, I don't know. My MSTE has the same problem, and I just use the external drive and be done with it. Others here might have a good suggestion for you or else you could FAX your question to Gadget's By Small, 303-791-0253.

I quite agree with some of your technical comments about the Falcon, Stefan. I think Atari _did_ cripple the machine somewhat (sorry, fellow Atarians) and I don't see how a Falcon = 98% VideoToaster, either. In fact, there are a _lot_ of things I'm unhappy about concerning the new machine. But I'm still excited about it and anxiously await its release. And why not?

HOWEVER... whether you _are_ or are _not_ insecure, the childish ravings you have been posting here certainly don't herald a high maturity factor. You don't like the Falcon? Fine. You are entitled to your own opinion as are others that _do_ like this promising machine. Why can't you leave it at that?

You would do well to take a lesson from Jason Steiner and other mature Amiga owners who at least are open minded enough to recognize the potential of other machines that don't carry the C= label.

If some over zealous Atarian is cross-posting in the Amiga newsgroups, I apologize. But flame HIM via email, and leave us be, OK?

I don't quite see what you mean ? As the new entry level machine I don't
see really any severe problems with the Falcon. That there is only one bus,
the old 1040 case and no real hi res, is if you think about in terms
of cost-reduction only rational.

I'd be disappointed if this was the high-end machine, as it's the low-end
I am quite happy. If the A4000 was Atari's new high-end, I'd be extremely
disappointed. (har)

I agree that the first posting was quite unnecessary (the one about
press coverage). But the second posting concerning the presentation in
Boston however wasn't, because the replied-to post contained severe
misinformation about the Falcon's capabilities. No company that want to
be taken seriously should make claims they cannot live up to.

>If some over zealous Atarian is cross-posting in the Amiga newsgroups, I

This is VERY interesting news (to me, at least), Ed. Could
you tell me how to get in touch with PMC? You see, I just saw
the Toad ad in CN for the Insite Peripherals floptical...the
price on that is $599 (with the Link and one disk included).
Your comments make it seem as if PMC has a similar product for
about $400, which would make it quite attractive! (I noticed
that PLI makes a floptical for the Mac, sold by MacConnection
for $479)...
In any event, the Freedome Floptical seems mighty
tempting...does anybody out there have one?

How about just releasing the sources to the general public. There sure
would be some hackers out there ready to improve the program. Also,
most PD development happens on a need-to basis.

If I use a program regularly and find it is missing some feature, I'm
always ready to pull out my trusty compiler and hack at it myself.

This is one reason why I try to stick to programs with available
sources.

Consider the net a large pool of highly competent programmers, and
release the stuff to us, the public.

Why convert to C ?
The type stictness of Modula-2 is just perfect for enhancing a program:
most errors are detected at compilation !
Of course, I don't know of a Modula-2 with MiNT libraries and that's
a problem. But the language itself is very nice !
And some systems (the PD LPR-Modula-2 for example) although not
perfect are really nice to use cause they have 'run-time linking' which
permit VERY short turn-around time !

Well, I attended the ECTS (European Computer-entertainment Trade Show)
about a month ago, in London, and Atari UK expressed that the bottom
of the range Falcon030 WOULD be on sale for #499 (four hundred and
ninety-nine pounds sterling). This is obviously excluding Hard
disk,etc, but at least it's cheap.

Antony.

> So again: Which standard is it?

I wonder what your problem is. If a 19200-standard is released it's just
a question of software to implement it. _That's_ the real advantage
behind this: we're already prepared for the (near) future.
And if the Falcon really supports the 14400-standard now, it would
be great for the moment.

I heard that because of some personal problems in the Gadgets family, they
didn't do very much in the last couple of months. As I heard it, the 3.1
Update is ready though and due for shipment any time now. But then again, I
don't believe it before I have it in my hands. By the way, it will not yet
support system 7.

This probably ought to go to c.s.a.s.tech, but the thread was started here so I kept it here...

I'm writing a game (in C) and have gone beyond the point that I can do all of my processing within the time allowed by one vblank. At present, it takes about 1 and a half vblanks to do what I need to do (on a stock ST), and I haven't even coded all of what I need to do yet. My fear is that, on a TT (for example), I can do all required processing in about a half of a vblank. If my synchronization scheme consisted solely of a call to Vsync() (which causes me to wait until the next vblank before continuing), I'd be doing one complete game update every 1 vblank on a TT and every 3 or so on an ST. This would not be good. :-) I want it to be the same on all platforms, even if that literally means sitting idle on a faster machine.

So, my question is, how can I ***FROM C, REMEMBER***, tell my code to sit idle until n vblanks have occurred. I would imagine I'll need to be in supervisor mode, and I wouldn't even begin to know how to do that, either. I'm using HSC (Ian Lepore's Heat & Serve version of Sozobon C)...

Someone (Warwick, I think) mentioned the existence of a memory location that might be of use. However, (1) I can't find the location and, (2) don't know how to get into supervisor mode to read it.

HELP!

Thanks!

John

Hi,

considering all these mervellous hardware expansions that have become
available for the Atari St during the years, I was wondering if there
is something available like this:
a small print with about three sockets that is connected via a
flatcable to a print that fits into the 68000 socket on top of which
again the 68000 is fitted.
This would remove the need to solder all these expansions on top of the
68000, which I think would be a scary job (soldering the 68000...)
Also I and other ST users with the same motherboard as I have (well at
least with the same design) could use more than one upgrade.
If I install a Maxon pixelwonder I am afraid I won't have the room for
the TOS 2.06 extension. This board with the sockets would find a
comfortable place where the memory banks used to be (XtraRam goes on
top of the shielding) Cause the way it is now expansions on the CPU
push the keyboard up...
By the way could anyone explain me how these extensions to 8 Megabytes
on a ST work? DO they include an extra MMU to support another 2 banks?
Well thats a lot of questions and I hope someone can at least answer
some of them.

Erlend.

Someone should take the project over who has the motivation and time
to make something nice out of it. If you think you can do that, write
to Jens. There's one thing I would like to have in TeXdraw:

What I think is a useful feature is that you can give a certain
point in the plane a name, say, A. Then when you move that point,
all objects that use that point will be (partially) moved. This
is VERY convenient when you're designing graphs. (i.e. when you
move a node all arrows from/to it will move as well.) Once the image
has been converted to TeX this is a trivial matter, but it should
already be possible in TeXdraw.

>Consider the net a large pool of highly competent programmers, and
>release the stuff to us, the public.

I don't REALLY believe this. The way Jens tried it by asking for
someONE on the news was a good idea. I don't have the time, but
I'd love to work on TeXdraw if I had the time (first thing: convert
the sources to C).

>a huge flop (just like all other Atari machines) and Atari will go
>bankrupt in no time when Commodore introduce their new AGA Low-end
>machines (same Gfx as A4000) by christmas.

Judging from the discussions seen here, there's a lot of interest for the Falcon. As to press coverage: while it may be true that almost no newspaper in the US had any coverage on the Boston unveiling of the Falcon (who am I to judge, as I don't have accesss to US newspapers), at least two big computer journals had coverage on the Falcon unveiling in Duesseldorf (Atari Messe) here in Germany, namely the ``ST Computer Magazin'' (which is the ST/TT magazine from the Heim Verlag, the Heim Verlag being very engaged on the subject Atari) and, from a more PC oriented side, a magazin called ``c't - Magazin fuer Computer Technik''. The latter has, in the meantime, published a review of the machine and was favourably impressed by it.

So, at least in Germany, the Falcon is off to a good start regarding press coverage.

BTW, c't also reviewed an Amiga 4000. This machine was also favourable received, BUT according to the review it does NOT have a SCSI interface. Can this be true?

And now, I will but out of this debate again, as I don't intend to get involved in flame wars of any kind. Anything hotter than an ice cube will get thrown down the drain, i.e. moved to /dev/null.

OK, I'll back-off on the severity of my criticism a bit. You are right, there are no really _severe_ problems with the Falcon. As an entry level machine, it's a dandy, and reasonably priced with the competition (new Amigas and mass market Macs, in particular). I wish they had done a few things differently and I wish they would market it differently as well, but all in all, it appears to be a great machine for the money. I just hope it's not too little too late.

I replaced the fan of my SH204 hard disk yesterday and I was
very surprised the air flow of the fan was outward. I expected
that they would want the fan to blow cold air into the unit
instead of the other way round, but I suppose I just had the
wrong idea.

WOW. I'm very impressed with this program - I just downloaded it from a.a. Does anyone know the source of this program? I'd like to reach the author, but all the About box says is "Th. Otto".

I've seen other resource editors, but ORCS outstrips them all - even the MWC one, which was impressive. Cool name too.

>PS. Is PMC Purple Mountain Computers? The company selling the
>Gemulator?

Since I've also received e-mail on the subject, I suppose there are others that are interested. I will send the press release here. If you don't want to read it, then skip this article.

THE PURPLE MOUNTAIN FREEDOM FLOPTICAL DRIVE 9/18/92

Bellevue, 98008 Now Available!

We took the ST industry by storm with the release of Gemulator, the Atari ST emulator. And now, we're doing it again.

We at Purple Mountain Computers have been busting our buns working overtime to get the Purple Mountain Freedom Floptical Drive ready for shipment. It takes the place of hard drive and removable cartridge drives (like the Syquest). This piece of hardware is incredible, so read this very carefully.

We are the first company to have floptical drive ready for the ST. Now. At the lowest price. In fact, read the end of this press release for the most incredible price you'll find on a floptical ST drive. And hurry, because the drives will last forever (well, almost) but the low introductory price won't!

The Freedom Floptical Drive (TM) is a 21 MB floptical 3.5 inch disk drive for Atari ST computers. You can store 21 megabytes on each rugged and portable diskette, and the media is fully removable.

Here's the scoop on the Freedom Drive:

* includes FREE 21 MB floptical disk

* includes newest version (currently 6.0.0) of ICD software

* just plug it in, includes ICD Link adaptor, case, and power supply

* reads 1.44 MB and 720K disks (2 to 3 times faster than ST floppies!)

* takes up very little space (4.7 x 7.8 x 2 inches)

The price? An incredible $399. Complete. Ready to go. You WILL NOT get a better price than this anywhere. We are operating at a loss to get a large number of units out the door and build up our user base. This is an introductory special and the price WILL go up (we think that will be sometime in October). There is a warranty, and we guarantee that the drive will work on your ST system. Questions? Call us. Write to us. Fax us. E-mail us (GEnie: PMC.INC, CompuServe: 72567, 302). Whatever you do, claim your low low price today. We are taking orders as you read this. Contact us for the current price.

We stand behind the Freedom Drive with full tech support. We also have an electric adaptor that makes it compatible with international currents. Floptical diskettes are $24.95 each in two paks (if you purchase a Freedom Drive from us), and $29.95 each for users who do not purchase the Freedom Floptical Drive.

Shipping in the United States is via Federal Express Insured and is $15. Contact us for shipping costs outside the US.

Purple Mountain Computers welcomes dealer/distributor inquiries. We know we'll be extremely busy taking orders for these units, so please be patient.

Color brochures are free, get in touch with us now to take your ST to the cutting edge of disk technology.

Purple Mountain Computers, Inc.
15600 NE 8th St. Ste. A3-412

I have an Archive Viper 2150S Tape Drive,but I don't have any technical data.
What it appears to be is a half height 150 Meg drive (SCSI port).
I have used it for several months now, for all my backups, with no problems.

What you need will depend on what you already have.
You will need:

(i) A host adapter to connect to the DMA port, I use a Supra adapter;ICD might be a better choice as it appears to be more popular.

(ii) Some sort of power supply, (+5 volts DC & +12 volts DC) with enough capacity,like you would use to power a hard drive.

(iii) Driver software. I use Alan Hourihane's excellent "Tapebios" software.This allows you to setup & test your drive & then go on to use as a backup device for your hard disk.

This setup will allow you to backup & restore whole partitions to the tape, you cannot backup files on their own. But in use it is so fast that it's easier to backup the whole drive while you have a coffee, than to sit a force feed floppies into the disk slot.

I don't have an address for any suppliers of host adapters, but they should advertise in the ST mags or someone else on the net may be able to fill in the blanks.

The Tapebios software is available on a.a.u.e.

>E-Mail: kovarski@zooid.guild.org

I would think most people here have a rather uninformed view of what I do
on this newgroup...basically I speak my mind. Rather small or large as it may
seem to most people, I do post meaningful information. I think my history
speaks for itself. And when I do post information its rather valuable,
so I take conmfort in the fact that those who refuse to read me in their
kill files don't get to take advantage of anything of value I post.

I haven't been able to post much lately as I am working two jobs saving money
for a 040 computer of my choice sometime in the future so I have a nice
machine I can run UNIX/X Windows on while I go to Grad school...somewhere?

Right now I see myself condeming my poor Mega STE too doom as a mail server
for uucp while I use perhaps a:

Next Dimension Cube??
Mac Quadra?
?????? Atari????

I love NuBUS's architecture so I will probably go with the MAC...or until
Atari can come up with something better???

Right now I am probably like many other Atari people out their, waiting for
my double life to end some day???

From: undermind!Steve_Johnson@overmind.mind.org
Message-ID: <2275965@overmind.citadel>
Source record: 216981

That's already planned. For about
$100 (for the hardware interface and software), you'll be able to use the DSP
as a modem with data rates up to at least 19,200bps. It'll also handle
FAX's.

3263. Re: ATspeed (or the like) for Falcon?

Newsgroup: comp.sys.atari.st

From: undermind!Steve_Johnson@overmind.mind.org
Message-ID: <2275956@overmind.citadel>
Source record: 216982

There's a 16MHz 386SX board for the Falcon030 being made by company name Sack in Germany. It will utilise the Falcon030's VGA graphics and such and (the best part) will only cost around $150. That's NOT a typo! $150!!! That's ALL!

The Falcon has an "industry standard SCSI-2" type port, whatever that means. :)

Perhaps some more hardware-knowledgeable folks here can explain the difference.
How does this differ from say, the "standard" SCSI ports used with Mac's?

Note that on the case of your SH204 there are vents at the front of the case.
The idea is to bring in cool outside air from the front of the drive box and
vent it over the powersupply and out the back. Doing so vice versa would
blow warmer air over the drive mech as well as dust particles. Just make
sure you reassemble the case with the vents to the front (opposite end from
the fan).

Source record: 216989

So when we talk about the possibility of making use of the
DSP 56k as a modem, is anybody out there who knows if the
appropriate software is available for the NeXT ?
As far as I know, the same DSP is in that machine.

How does it work there ? If there is some thing existing,
then the discussed hardware adapters for hooking off, handling
phone voltages etc. should be available already.

Any infos ?

Thomas.

There's an address (in Germany) for the author, given in the accompanying
README file - I didn't get it off a.a., but I _assume_ the readme was in
the a.a. distribution? Andrzej Wrotniak has a very favourable review of
ORCS in the September issue of Current Notes.

Message-ID: <69249@hydra.gatech.EDU>
Source record: 216990

Laser C's library lib881.a supports the 68881 FPU. You probably
won't see a big increase in speed with just straight multiplies and
divides - especially with 32 bit floats. This is due to the speed
data is transferred on the bus. Big improvements will occur with
the built in functions (like the trig functions) since all the
calculation will occur in the FPU.

> collecting my money to buy one...

Whatever. No one here stopping you.

The A4000 didn't really turn out to be what CBM was originally telling developers, did it?

Kinda dropped the AT&T 32 series DSP didn't they? The hot new graphics chips really only give you 8bit plane depth and 8bit ham modes... (Plus bigger/better sprites. Joy. I don't think I need an '040 game machine.) Did they keep the PCMCIA expansion port? Does it have internal SCSI support anymore? (I honestly don't know the answer to the last two.)

Commodore is just as guilty at changing specs as Atari is. Having followed development of both Falcon and 3500 the Falcon turned out to be much more a 'step-ahead' machine than the A4000. The 4000 really just brought CBM back up to 'state-of-the-art', nothing ahead.

means. :)
>

My guess will be that it's like the one on NeXT's and Suns. That's a 50 pin dual header style (two rows of 25), but with tight pin spacing so that all fifty contacts fit in the area of a standard D-sub 25 pin plug.

Most Macs use the standard D-25 connector for external SCSI. There are 18 signal lines connected to the DB25. It's quite possible that the Falcon uses a 'SCSI-2' CONNECTOR and not an actual SCSI-2 bus, so that half of the 50 pins are probably ground and the 18 active lines are mixed in with the other 25.

(NeXT and Sun both do this-- you don't get 'real SCSI-2', but you are allowed to pay extra for the more expensive cable. :-)

>

Wow, I'm just posting all over today... :-)

If you recall the original announcements for the NeXT, they too were billing the internal DSP as having capabilities for 9600 baud modem in software. Never happened. I think it was too much of a load for one lowly 56K.

Maybe the extra clock speed on the Falcon's 56K will help. Also (and *very* improtantly) does anyone know the size of the Falcon's local DSP SRAM? Could be bad news if it's 32K or less... :-(

[I post this message approximately once a month. New games are on the way; they're in beta-test now and we're mainly waiting on a stable version of the latest TADS. Watch this space for more info.]

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with great puzzles and evocative descriptions without resorting to using any graphics at all? We really miss the emphasis on gameplay rather than glitz, so we've decided to write our own adventure games along the lines of the early games we liked so much.

If you're looking for top-quality interactive fiction comparable to 1980's commercial offerings, check out the Unnkulian Unventure series of games, shareware text adventures available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of Kuulest's slave, and must recover the Orb of Studosity from the evil Unnkulians. Kuulest, the old geezebag, has died and left you with nothing to go on but a cryptic message about saving the planet. You'll encounter amazing Acme products, the infamous Guardian, those witty creatures known as Drolls, a giant beaver, and even the Unnkulian Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure continues as you try to create some good press for yourself -- wouldn't want to fade into anonymous obscurity, now would you? Along the way, you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdhist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

The Unnkulian Unventure games have already gotten rave reviews from numerous adventure game connoisseurs, so why not give them a try?

The games are available for FTP:

PC and compatibles:
---

msdos.archive.umich.edu:

msdos/games/textadv/unnkul12.arc
msdos/games/textadv/unnk2v20.zip

Mac:
---

mac.archive.umich.edu:

mac/games/adventure/unnkulian1.03.sit.hqx
mac/games/adventure/unnkuliantwo2.0.sit.hqx

Atari ST:
----

atari.archive.umich.edu:

atari/games/tads/unnkul12.arc
atari/games/tads/unnk2v20.arc

Amiga and Unix:

We get a lot of requests for Amiga and Unix versions of our
games. We'd love to have versions running on all the
major machines, but unfortunately converting our games
to other platforms is beyond our control since the games
were written with a system called TADS; TADS only runs
on PC's, Mac's, and Atari ST's. If you'd like to know
about plans to port TADS to other platforms (if there
are any such plans), you can send email to Mike Roberts,
principal author of TADS, at <73737.417@compuserve.com>.

He gets flooded with mail about this every time I post
this message, though, so please be kind and brief for
his sake.

Notes on where to obtain TADS itself are included below.

Both Unnkulian games are shareware ($10 registration fee for each) --
registering gets you maps and hint sheets from the authors. Support us
and you'll continue to see fun text adventures like these.

Questions and comments are welcome!

Late-breaking news: Look for _Unnkulia 1/2: The Salesman Triumphant_
coming to an archive site near you, along with demos of _Unnkulia
Zero: The Search for Amanda_ and _The Legend Lives!_, the first
adventure in the science fiction Unnkulian Universe Unventure series.
Three exciting new Unnkulian games for you to fry your brain with!
What could be better?!

Dave Baggett
dmb@ai.mit.edu

Appendix A

Where to get TADS via FTP:

TADS is available for the PC, Mac, and Atari ST, from the following sites:

msdos.archive.umich.edu: msdos/games/textadv/tads.zip
atari.archive.umich.edu: atari/games/tads/tads.lzh
mac.archive.umich.edu: mac/games/games.utilities/tads1.04.cpt.hqx

TADS is also shareware, and we strongly encourage you to register if
you use it since we feel it is a powerful, innovative, and very inexpensive
development system that deserves to be paid for.

3279. New DeskJet driver for GCR now available

Newsgroup: comp.sys.atari.st
Date: 1992-09-28 22:43:18 UTC
From: wmagro@uiuc.edu
Message-ID: <BvB8G6.420@news.cso.uiuc.edu>
Source record: 216996

I just received mail from Ollie Arnberg, author of a freeware printer driver for the Macintosh. He has updated the driver to version 3.0b0. This beta version is much improved over version 2.1. It adds landscape printing and has several internal improvements to make printing better. A 100K .hqx file is available directly from the author. Send a request to:

hpdj-bugs@hut.fi

I can send you his mail announcing the new features. Just ask.

>I recently bought a fax modem (US Robotics Sportster) and would like to
>send faxes with it... but I have no atari FAX software. Is there some
>(public domain or else) available? Where? At what price?

I'm not trying to plug them or anything, but the only FAX product I know
of for the atari ST/TT is STraight FAX! from Joppa Computer Products.
From the Joppa catalog dated 7/8/92, it says that STraight FAX! is
introductory priced at $69.95 (US). It now retails for $89.95, but can
be found for $69 from Toad Computers (among others).

From Joppa's ad:
- send/receive FAXes with an Atari ST/TT computer using any standard
Class 2 FAX modem to/from a group III FAX machine at speeds up
to 14400 baud.
- supports sending of ascii text files, image files, degas files, or fax
files created by included printer drivers for calamus,
pagestream, and fsm gdos.
- supports printing of received FAX files using standard fsm gdos
printer drivers.
- 100 number dialing list, send and receive fax logs, automatic cover
page generation, broadcast fax to multiple destinations,
scheduled fax transmissions
- view up to four fax pages at a time with crop editing capability.
- full gem user interface with keyboard commands for menu and button
selection, pop up menus and on-line context sensitive help.
- direct scanning of faxes using popular hand scanners.
- 1 MB of RAM required. 2 Mb of RAM and hard drive recommended.

Hope this helps you out.

The version on atari.archive.umich.edu (Directory atari/Utilities/ filename
orcs.lzh)
only has the ORCS.PRG file and ORCS.RSC file. It doesn't have the ORCS.HLP
file, or any documentation otherwise. (Nor does it have any sample ORCS.INF
file - which is created upon the users request anyway!)

A program this good can't possible be PD can it? The previous versions were
commercial, and this is 50-times better?! I'm very impressed! (I can finally
edit my desktop icons properly!!)

If anyone knows an FTP site with the FULL archive (with all files,
ORCS.HLP etc.) Could they please tell us! It has a LOT of features, some of
which aren't completely self explanatory! (I'm using it okay, but I'd like to
know more!!)

Also:

Does anyone know of a program called 'Twister'. Which is a task-switching
program. (Similar to MiNT, except it has 'multiple ST's' instead of one
running several things at once. It's (from memory) the sequel to 'Revolver'.

Any information on the location of a version of it (demo/shareware??) or an address would be great!

And:

Anyone with information concerning the conversion of Noise/Soundtracker MOD's into TCB-Tracker format. (Or playing of Noise/Soundtracker MOD's through the 'Monster Sound Cartridge by MPH). Could they please contact me - or tell me of programs to do so!

Thanks in advance:

Steven Wells
(WELLS_S@KOSMOS.WCC.GOVT.NZ)

Yes putting a High Density Drive in the SCSI chain would work, now
Weather or not you could use it for Drive A (probably not)
Spectre would see is as a HardDrive thats 1.44meg big, and there for
not be compatable with Apple file exchange as a IBN drive, but it would
probably see it as some sort of removable medium drive thats formatable
under the Spectre Hardrive menu. "If it can be formatted as a Gem Dos
Partition it can be changed into a Spectre Partition"

As for AT speed and Supercharger, I have no Idea.

This would be my guess as to how this device would be treated based on my
experience with Spectre and the ST, Not impirical definate attempted
results.

But it would be good never the less for backing things up with....

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <66805@cup.portal.com>
Source record: 217002

Kevin Isaacson asked about the Dungeon Master "hint disk"..

There WAS a commercially distributed "hint disk", but it was
full of errors and omissions..

The maps and spells were directly copied from the work Michael
Stetter did.. ("unmappable Clockwise Room," indeed..!)
including the bogus "Confuse Monster" spell..

The fatal flaw though was that the disk was useless while you
were playing the game, unless you had TWO computers.. you had
to save the game, boot the hintdisk, fuss with the maps, then
reboot and wait for Dungeon Master to load all over again..

On the other hand, Unicorn Publications (the publishers of AIM)
are now distributing the new edition of my hintbook..
E-Mail me if you'd like to find out how to get one.

This is the only thing that Atari should change about the Falcon 030!
I think a better marketing description for it (rather than
personal int. media or PIM) would be something like Atari AVI
(Audio Video Intelligence). First, the Latin root meaning bird/flight
is "avi" as in aviator, aviary, etc. Second, it is more descriptive
of a new category of smart electronics/devices that might become the
virtual brains of a home. Third, I think it sounds better than
Atari PIM. If anybody agrees send Atari your suggestions!

Jack

>definitions of some of the features.] These video capabilities loan themselves
>to these applications: television picture in picture, video effects, CD Photos
>(just add a CD ROM player).

Previous calculations of memory bandwidth were based on 60 Hz vertical
refresh so the 72 Hz means the Falcon is at least 20% faster! Also
800x600 at 60 Hz uses almost the same bandwidth as 640x480 at 72 Hz
so the Falcon should handle it without much slowdown. Maybe even
a mono 2048x2048 60 Hz mode is possible too (to show off mono paintings)?
Even at that high rez the audio could go full speed so it might have
applications in a museum or information kiosk.

The reviews of the Boston showing were great! (Wish it were all
captured and MPEG encoded on a CD-ROM or something)

>the sources to C).

Well, I see your point. Indeed the ideal thing would be if somebody
would take over the program, but I can't help being just a tiny bit
sceptical that someone would.

Taking myself as example, I had tried TeXdraw and liked it a lot. Also
there was a feature that I felt was missing concerning a \multiput
like input facility. In that case I would have loved to have the
sources at hand and give it a go. I would however not like to get the
sole responsibility for enhancing and maintaining the program.

I think that the most excellent GNU support is to be considered a
happy example that indeed PD development is possible, but in
retrospective, those packages is actually maintained by net.gurus who
has the actual responsibility to update the stuff. So I still think
that the sources should go public, at least unless some highly
motivated GEM/Modula-2 comes forward.

NO ! I state facts not fiction, go look at what a STE sold for $800a and
look at the USA price of the same, its some 3 * the USA price...

So 3 * $799us = $2397a, its that simple..

We do have Atari OZZ working here and a dealer here has quoted $2500nz,
So if you can't live with the truth may be you need to get a PC..??

I believe it means the type of connector you get on Sun SPARCstations, ie a
50 way micro-D socket (female).

From: etlgtme@etlxd32l.etlxd
Message-ID: <1992Sep29.101733.8878@ericsson.se>
Source record: 217016

Hi Folks,

I'm trying to compile a program in STOS basic. (don't ask me why !!)
I use the compiler to generate a .PRG(GEM) file and when I run it from the desktop it runs OK until its time to quit and return to the desktop. At this point the desktop appears (flashing) with 9 bombs (sometimes 3 or 4 bombs) and everything is hung. I've tried removing all accessories but that didn't help.
I managed to get it running from a floppy instead of my hard disk but I had to change resolution at least once for it to work (ie low -> medium). Weird !
In short, it never works from the hard disk but sometimes from a floppy if I switch the hard disc off and re-boot. Anybody got any ideas !!??
My setup is: 520 STFM upgraded to 2 Megs (Xtraram DeLuxe)
TOS 1.62
Gasteiner 50 Meg Hard Drive (Seagate mechanism)

Cheers, Grant.

Bill, any idea how this driver compares to other Mac drivers
in the area of speed? I use JetLink Express by GDT and have
been very happy with it, except for its speed when used with
Spectre. I had occassion to use it on a true-Mac once when my
ST was being repaired and was amazed at how much faster the
printing was...

What do you put in the word subsiduary?

Commodore have in Norway decreased its staff from 29 to 8 employies. And they are only focused on selling PC-clones. Try to ask them a question about the Amiga, they do not know much... Thats for sure.

Over to Atari a BIG Norwegian firm has taken over the import and distribution of the ATARI in Norway. This info comes from Atari USA or more presisely its representative in Finland. The old Atari Norway was closed down, but who is sorry. I am not. They had just one man who knew anything about the machines anyway. He was not put into work by Atari before a year or two ago...

As for Sweden it was an internal disagreements that led to the temporarily closedown. Atari will soon find a replacement, I am sure of that. Before its closedown they were selling 2000 units of ST/STE/TT`s per month. Thats not so bad.. Is it?

Commodore... PRICE WITHOUT THE POWER....

Rune Hyldmo

3304. Re: 1.4 meg floppy on an ST?

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 11:26:06 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Sep29.112606.2811@aston.ac.uk>
Source record: 217030

Fitting a 1.44 Mb floppy to an ST (_any_ ST) is possible, as the ST
I've just bought from a friend has one fitted. It formats quite happily
up 82 tracks and 20 sectors using Diamond Format giving something over
1.6 Mb of space, and quite happily reads PC HD disks as well, and works
fine on (I think) all TOS versions- I'm using 1.4 but when he did the
upgrade he had 1.0 installed. What you have to do (this is from memory,
and I wouldn't know how to do it myself so please don't flame...) is
replace the 8Mhz signal coming into the drive with a 16Mhz signal and then
set the drive seek rate to 6 ms. and it seems to work fine. I think you
still have to set a switch depending on whether you're using 720k or 1.44
disks, but you could probably wire this to the HD detect pin which most
drives have (I've got a switch on the front of the tower case). I also
think I've got an arc file on a disk magazine somewhere which claims to
have instructions and source code (probably unnecessary) for fitting
a 1.44 Mb drive- I could upload it to atari.archive if people want. I'll
try to answer any questions, but bear in mind I didn't do the upgrade
myself; I just use it!

I have a DM/CSB dungeon editor prog, if anyone wants it...

It's a much-improved version of the CSB editor program which appeared on an
ST Format coverdisk over 2 years ago.

I use FTP to download software from a mainframe.
If you want to download directly to the atari this protocol is NOT faster
than kermit (I use the KA9Q TCP/IP on Atari). If you have access to other
PCs etc. directly connected (via ethernet) to the internet this is the
best way. (about 40Kb/sec)...

Bye,
Wolfgang.

3309. Spectre 3.0 and 68020 ?

Hi there...

I tried a friends spectre GCR 3.0 with my 68020/68882 Board (a PAK68/2) and found out, that it doesn't work... it starts up and tells me, that I'm wellcome... and thats it. We tried it both from harddisk and from floppy with system 6.04, 6.05 and 6.07 and also with the cache enabled and disabled.. but it was all the same. Does anybody know why this happens or what to do against ? May this problem be solved with spectre 3.1 ? Any hints are wellcome !

P.S.: the spectre does not completely hang, it is still possible to enter the configuration-page with shift-help...

From: stefan@spc.nl
Message-ID: <1992Sep29.144653.21430@spc.nl>
Source record: 217031
Cross-posted to: comp.sys.atari.st,biz.jobs.offered

We are looking for people with experience in 68000 as well as C coding to develop games on the new CD-Interactive machines. This involves lots of 68000 and a little C thrown in just for the hell of it.

People with lots of 68000 experience (like people from the demo/games coding world) as well as creativity and time (we're talking about at least one year full time here) who want to work on a totally new machine with interesting hardware and possibilities, who have no objection to working and living in Holland for a while can contact me at stefan@spc.nl

SPC is an official CD-I development house, and some of us did a little 68000 shoot-them-up as a pet project. This has become larger than life, and now we need people for all those other games they want to do. If coding 68000 games/demos is what you always did, and what you want, this could be for you. Send me some email and we'll talk about it.

>
>This is the only thing that Atari should change about the Falcon 030!
>I think a better marketing description for it (rather than
>personal int. media or PIM) would be something like Atari AVI
>(Audio Video Intelligence). First, the Latin root meaning bird/flight
>is "avi" as in aviator, aviary, etc. Second, it is more descriptive
>of a new category of smart electronics/devices that might become the
>virtual brains of a home. Third, I think it sounds better than
>Atari PIM. If anybody agrees send Atari your suggestions!

I like the term "personal integrated media" better because Atari seems to
want to get into the multi-media...

Audio/Video would restrict it to audio and video.

I see your point though--"PIM" will sound a little funny comparable to "PC".

As long as Atari doesn't use "PIM", it should be ok.

Maybe "IMC" would be better. "Integrated Media Computer".

3314. A newest "mines clearer" game on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 15:01:45 UTC
From: doucet@ripolin.laas.fr
Message-ID: <7878@laas.laas.fr>
Source record: 217027

Hi happy netters,

Preliminary: this post is only of concern for people that have nothing better
to do that waste their time playing games...

Now that we are in limited company, straight to the subject:
I've uploaded a little game last week on atari.archive, which is called
Hexmines and is currently in the atari/Newitems directory (mind the
capital N). It should be soon on the Clausthal site in Germany.

This could be a "classical" find-the-mines-in-the-field game, except for
some features:
- tiles are hexagons instead of squares: this changes the game much;
- several parameters can be set: number of bombs, number of lives
(so as not to quit the game at the first explosion), and the
number of "open zones" at the game's start.

It's a low rez only program that should run fine on ST/STE, but
I guess not on TT and even less on Falcon. Don't know for Mega ST/STE.

Also, it's the first (1.0) version, fully functionnal but whose sole
goal is for me to get ideas/suggestions/remarks in order to improve the
game. So I wait for to hear from you.
Alse about bugs reports: the first one who finds one bug will automati-
call receive successive new versions all his lifetime (or mine).
Version 1.1 is ready (nicer dialog boxes + varying field size) but I'll
wait a little before to upload it; see above.

Last thing: it's a free (i.e. not shareware) program, so you can go on...

A bientot.

3315. Atari.archive.umich.edu :FAQ

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 16:02:24 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Sep29.160224.6490@terminator.cc.umich.edu>
Source record: 217028

Here it is folks, the answers to life's great mysteries:

Welcome to atari.archive.umich.edu's Frequently Asked Questions

Updated on: Sept 29, 1992

1. How can I access the archive?

You can access the archive in one of two ways: by our mail server, BART, or via anonymous ftp. To get information on the mail server, please send mail to atari@atari.archive.umich.edu with a body of 'help'. For information on anonymous ftp, please refer to my 'Beginner's Guide to Anonymous FTP,' which is frequently posted here. Questios about BART should first be addressed to the help file, then to Jon Brode, jon@atari.archive.umich.edu.

2. When I try to log in via ftp, I get a message saying that the archive's host won't accept anonymous ftp from my machine because of some mapping problem. What can I do to fix this?

The archive's host machine will attemt to map your machine's ip address back to a name. If it is unable to do this, it will not let you begin an anonymous ftp session. Please ask your sysadmin to check the name server entries for your machine, as something is amiss along the way. If he or she isn't able to solve the problem, please have them send mail to me and I'll have the folks here take a look and see what's up.

3. How can I upload things to the archive?

You can upload via ftp or by sending uuencoded chunks to me (address below). Please refer to 'How to upload to atari.archive' (frequently posted here) for more information.

4. After I've posted files to the archive, it often takes a few days before they're available to the public. What sort of queueing system do you use?

The queueing system in place here is known affectionately as my spare time. I try to make files available as soon as I possibly can, but often times my schedule dictates otherwise. Please bear with me.

5. What is {MiNT, TeX, Gnu, etc.}?

Please refer these questions to the authors of the software. Often times I know very little about a piece of software that is posted here.

6. What is the ip# for atari.archive.umich.edu?

141.211.164.8, at least for the time being. It's a good idea to always use the a.a.u.e name.

7. What are the ???s in the index for?

A ??? signifies that I don't know what the file is or does. Please feel free to contact me should you happen to know the answer.

8. Where can I go for more information about the archive?

Please feel free to send mail to weiner@atari.archive.umich.edu and I'll try to answer your questions. Questions about BART should be addressed to its author, Jon Brode (jon@atari.archive.umich.edu).

9. Isn't there some times that I shouldn't ftp?

Yes. Please try to keep your ftp use between the hours of 5 pm to 7 am, EST. This will greatly appease the people that actually work on this machine. We are generally -4 GMT.

Cheers,

--

3316. Beginner's Guide to Ftp

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 16:04:47 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Sep29.160447.6624@terminator.cc.umich.edu>
Source record: 216892
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
ls -F : Lists filenames, but adds a / to the end of directory names.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.
~~~~~~

This from redmond@IUS4.IUS.CS.CMU.EDU:
For more than one argument to ls, use double quotes. Eg. ls "-FC *.lzh"

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc.
please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

3317. uploading to atari archive and c.{b,s}.a.st

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 16:06:09 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Sep29.160609.6725@terminator.cc.umich.edu>
Source record: 217029
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bitt

```
Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Guardian

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with
megs and megs of stuff, not to mention it's a bit easier for you too.
Logon to the archive as usual, then issue the following commands

cd ~atari/New
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."

This last step is very important. As we're now integrating the
index with text and the ls -lR listing, descriptions and an address to
send questions to are key.

Ed Krimen, ekrimen@ecst.csuchico.edu, adds this:

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

2: MAIL - This is a bit slower for you and for me, but is still very effective.
Simply uuencode the file, (please split it into parts ~=60 K or less please)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpfull as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled file transmission, containing a short description of
the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear
in comp.{binaries,sources}.atari.st, the following is taken from Steve
Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication
```

Items intended for posting or queries and problem notes should be sent to atari-binaries@spud.Hyperion.COM. If you are on a UUCP-only site, you can send them to {backbone}!spud.hyperion.com!atari-binaries.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@twitterpater.eng.sun.com. If you are on a UUCP-only site, you can send them to sun!twitterpater.eng!atari-sources.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas'

"uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

3318. Printing with Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 16:10:56 UTC
From: malay@sae.com
Message-ID: <1992Sep29.161056.11806@sae.com>
Source record: 217043

I need a MAC print driver for a HP-IIP printer connected to the ST so I can print from Mac-mode. I own GDT Softworks Printlink in which I change my printer to emulate Epson LQ but the print quality from MacWrite II and/or MS Word 5 is bit flakey. GDT apparently has a new product "PowerPrint". Also, looking through the MAC catalogs I came across something from Insight called MacPrint. I also own a used copy of Freedom of Press Light but the modified AppleTalk that comes with FOP seems to hang the system when booting up so I have never seen that quality of the print.

Current Commercial Drivers:

GDT PowerPrint
INSIGHT MacPrint
Freedom of Press Light

Anybody have any luck with any of these????

Bob Malay

I got it about a week ago from clausthal (sun.rz.tu-clausthal.de), in ~pub/atari/programming. The same 5 files listed by Herwig were in the package. No .HLP file.

3321. Fontgdos

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 16:34:22 UTC
From: jtreichl@iiic.ethz.ch
Message-ID: <1992Sep29.163422.21873@neptune.inf.ethz.ch>
Source record: 217032

I have a problem with the fontgdos. probably i missed the discussion about
the it.

1. i installed the cpx modules and generated the assign.sys and
the extend.sys file. they seem to be correct.

2. put fontgdos.prg in the auto folder an boot.

3. i wrote a little test programm with a vst_load_font call for
the screen device.
GDos error: not enough cache memory.
but i have set the cache sizes on 20,20,200 and no font is bigger
than 60kByte.

what's wrong.

regards
Juerg

3322. Re: Press Coverage of Falcon?

Newsgroup: comp.sys.atari.st

>(public domain or else) available? Where? At what price?

The only fax software that I'm aware of for the ST is STraight Fax from Joppa Software. I just got it last week, but haven't tested it out. From what others have said, it's pretty good.

BTW, I have a Supra V.32bis faxmodem, and I just ordered my new ROMs last night via their BBS.

>I'll check it out and let you know.

This has already been discussed, but the Atari supports hardware thru.
I have a cable that has Midi out & thru, and works automatically. The
other two pins on the 5-pin din are used for this. If anyone wants this
cable, I have two and could spare one. $15 including shipping.

3325. Newbie C question.

Newsgroup: comp.sys.atari.st
Date: 1992-09-29 17:37:47 UTC
From: rasas@minyos.xx.rmit.oz.au
Message-ID: <rasas.717788267@minyos.xx.rmit.OZ.AU>
Source record: 217038

For some reason this (very small) piece of code id doing wierd things.
fpath is the string returned from fsel_input(fpath, etc...)

```
re_name()
{
int i, count;

i = count = 0;
for(i = 0; i <= strlen(fpath); i++)
if(fpath[i] = '\\')
count = i + 1;
printf("count = %d", count);
strncpy(fname, fpath, count - 1);
}
```

After the for() loop, count equals the length of the entire string + 1. It's
as if the if(fpath[i] = '\\') isn't even seeing the slosh (backslash).
I am using Sozobon2 (if that means anything)...

My appologies if this is really stupid but I can't seem to see it.

Thanks for reading,

Greg.

In a message of <28 Sep 92 16:15:26>, Stig Vidar Hovland (60:100/1) writes:

SV> From: stigvi@Lise.Unit.NO (Stig Vidar Hovland)
SV> Organization: Norwegian Institute of Technology
SV>
SV> Can someone tell me what kind of plug Falcon have for the SCSI
SV> port. I know it have 50 pins, but is it a ordinary or a mini delta
SV> ribbon and is it male or female?

Here is some information from a information file about the Falcon, from
Atari Benelux:

SCSI CONNECTOR (flat 50 pins SCSI II Female)

Pin Signal Pin Signal

1-10 GND 37 Not Connected
11 +5V 38 +5V
12-14 Not Connected 39 Not Connected
15-25 GND 40 GND
26 SCSI 0 41 ATN
27 SCSI 1 42 GND
28 SCSI 2 43 BSY
29 SCSI 3 44 ACK
30 SCSI 4 45 RST
31 SCSI 5 46 MSG
32 SCSI 6 47 SEL
33 SCSI 7 48 C/D
34 Parity 49 REQ
35-36 GND 50 I/O

It appears though, that on Sun and NeXT computers, pin 11 is at GND, not
+5V... so be careful in connecting anything...

In my days of lusting for a NeXT (before I got a TT) I did read of some software/hardware gadgets that turned its DSP port into a modem and even a voice ansering machine. But these devices were on the order of several hundred $$--I don't know if that's because they had to be (I doubt it) or if someone was making a nice profit (but then, if you've bought a NeXT, what's a little more cash?).

> James Busby

If you already have the ppm-utilities from the pbm-plus package available, you can get ppmtoraw.lzh from the New-directory at atari.archive.

You can then convert a GIF-image to RAW by doing the following :

```
giftoppm pic.gif | pnmscale -xysize 320 200 | ppmtoraw >pic.raw
```

The result is really quite good!

>The dps buss, is it a 32 bit ninja bus or a crippled SX slave bus?
>The blitter, is it a speeded version of the Ste blitter or an enhanced version?

>Many thanks.

DSP bus - was named SSI in and out, I did not follow up to get explicit
details on it, so I'm not sure what more I can tell you. Related information,
the DSP port (which will give a clue to the bus) is a DB-26 pin port.

The Blitter is a 16MHz enhanced STE version: there are new functions,
supposedly, but that's all I know.

You're welcome!

>TOUCHUP, PAGESTREAM and a host of other programs.

Using TOUCHUP takes too long. First you have to load your pictures one by one into TOUCHUP, which is very slow, and then save them. Only then can you run OUTPRINT, a separate program that does batch printing. Even files that are already in .IMG format cannot be printed by OUTPRINT unless they have first been processed by TOUCHUP to produce auxilliary .GEM metafiles.

Having to go through all this is why I stopped using TOUCHUP. Perhaps they have fixed this in a more recent release?

Something should be added to the FAQ about the problems one can have trying to use MS-DOS-formatted floppy disks on the ST. TOS can fail to recognize that you have put in a new floppy disk, and this can result in a trashed directory or TOS insisting that a disk is completely blank. The cause, as I understand it, is that when formatting a disk the ST puts a random number into the boot sector (that is used to detect when the disk has been changed), whereas MS-DOS puts a fixed number number into this location.

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)

*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom
(i.e., 0 is first). For each scan line, all the data for a given bit plane

appears before any data for the next higher order bit plane. Note that this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

Note that the Spectrum 512 mode's three palette changes per scan
line allow more colors on the screen than normally possible, but a
tremendous amount of CPU time is required to maintain the image.

The Spectrum format specifies a palette of 48 colors for each scan line.
To decode a Spectrum picture, one must be know which of these 48 colors
are in effect for a given horizontal pixel position.

Given an x-coordinate (from 0 to 319) and a color index (from 0 to 15),
the following C function will return the proper index into the Spectrum
palette (from 0 to 47):

```
/*
* Given an x-coordinate and a color index, returns the corresponding
* Spectrum palette index.
*
* by Steve Belczyk; placed in the public domain December, 1990.
*/
int
FindIndex(x, c)
int x, c;
{
int x1;

x1 = 10 * c;

if (1 & c) /* If c is odd */
x1 = x1 - 5;
else /* If c is even */
x1 = x1 + 1;

if (x >= x1 && x < x1 + 160)
c = c + 16;
else if (x >= x1 + 160)
c = c + 32;

return c;
}
```

<Spectrum 512 (Compressed)> *.SPC

```
1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
--------------
<= 50014 bytes total
```

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

NOTE: Regarding Spectrum pictures, Shamus McBride reports the following:

"... [The Picture Formats List] says bit 15 of the color map vector
must be zero. I've encountered quite a few files where [bit 15] is
set (with no associated palette entry)..."

<Spectrum 512 (Smooshed)> *.SPS

This format compresses Spectrum 512 pictures better than the standard
method. There are at least two programs that support this format, SPSLIDEX
and ANISPEC, although the two seem to differ slightly in their interpretation
of the format.
One point of interest: Shamus McBride deciphered this format without an ST!

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= ? bytes compressed data bit map
<= ? bytes compressed color bit map

< ? bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to that used in Spectrum Compressed (*.SPC) pictures.

The data map is stored as a sequence of records. Each record consists of a header byte followed by one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x (unsigned):

0 <= x <= 127 Use the next byte x + 3 times
128 <= x <= 255 Use the next x - 128 + 1 bytes literally
(no repetition)

There are two kinds of *.SPS files.

The data may appear in the same order as *.SPC files (SPSLIDEX format?):

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

The second variant (ANISPEC format?) encodes the data as byte wide vertical strips:

Picture data, bit plane 0, scan line 1, columns 0 - 7.
Picture data, bit plane 0, scan line 2, columns 0 - 7.
Picture data, bit plane 0, scan line 3, columns 0 - 7.
. . .
Picture data, bit plane 0, scan line 199, columns 0 - 7.
Picture data, bit plane 0, scan line 1, columns 8 - 15.
Picture data, bit plane 0, scan line 2, columns 8 - 15.
. . .
Picture data, bit plane 0, scan line 199, columns 312 - 319.
Picture data, bit plane 1, scan line 1, columns 0 - 7.
. . .
Picture data, bit plane 3, scan line 198, columns 312 - 319
Picture data, bit plane 3, scan line 199, columns 312 - 319.

A for loop to process that data would look like

```
for (plane = 0; plane < 4; plane++)
for (x = 0; x < 320; x += 8)
for (y = 1; y < 200; y++)
for (x1 = 0; x1 < 8; x1++)
image[y, x + x1] = ...
```

Color map compression:

Color map compression is similar to *.SPC color map compression, but the map is compressed as a string of bits, rather than words. There are 597 records (one for each palette). Each record is composed of a 14-bit header followed by a number of 9-bit palette entries. The 14-bit header specifies which palette entries follow (1 = included, 0 = not included). The most significant bit of the header refers to palette entry 1, while the least significant bit refers to palette 14. Palette entries 0 and 15 are forced to black (zero). Each palette entry is encoded as "rrrgggbbb".

The format of the palette is described above in the section on uncompressed
Spectrum pictures (*.SPU).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)

32000 bytes total

<Cyber Paint Sequence> *.SEQ (low resolution only)

This format, while fairly complex, yields excellent compression of animated
images while offering reasonably fast decompression times.

1 word magic number [$FEDB or $FEDC]
1 word version number
1 long number of frames
1 word speed (high byte is vblanks per frame)
118 bytes reserved
----
128 bytes total for .SEQ header

for each frame {
1 long offset to data for this frame, in bytes [basically useless]
}

for each frame {
1 word type (ignored?)
1 word resolution [always 0]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits [not used]
1 word color animation speed and direction [not used]
1 word number of color steps [not used]
1 word x offset for this frame [0 - 319]
1 word y offset for this frame [0 - 199]
1 word width of this frame, in pixels (may be 0, see below)
1 word height of this frame, in pixels (may be 0, see below)
1 byte operation [0 = copy, 1 = exclusive or]
1 byte storage method [0 = uncompressed, 1 = compressed]

1 long length of data in bytes (if the data is compressed, this
will be the size of the compressed data BEFORE decompression)
60 bytes reserved
----
128 bytes total for frame header

? bytes data
}

Frames are "delta-compressed," meaning that only the changes from one frame to the next are stored. On the ST, .SEQ files are always full-screen low resolution animations, so the sequence resulting from expanding all the data will be n 320 by 200 pixel low resolution screens, where n is given in the .SEQ header.

Since only the changes from frame to frame are stored, image data for a frame will rarely be 320x200 (except for the very first frame, which will always be a full screen). Instead what is stored is the smallest rectangular region on the screen that contains all the changes from the previous frame to the current frame. The x offset and y offset in the frame header determine where the upper left corner of the "change box" lies, and the width and height specify the box's size.

Additionally, each "change box" is stored in one of five ways. For each of these, the screen is assumed to have the full-screen image from the last frame on it.

o uncompressed copy: The data for this frame is uncompressed image data, and is simply copied onto the screen at position (x, y) specified in the frame header.

o uncompressed eor: The data for this frame is exclusive or'ed with the screen at position (x, y).

o compressed copy: The data for this frame must be decompressed (see below), and then copied onto the screen at position (x, y) specified in the frame header.

o compressed eor: The data for this frame must be decompressed (see below), and then exclusive or'ed with the screen RAM at position (x, y).

o null frame: The width and/or height of this frame is 0, so this frame is the same as the previous frame.

Of the 5 methods above, the one that results in the smallest amount of data being stored for a particular is used for that frame.

Compression Scheme:

Compression is similar to that employed by Tiny, but is not quite as space-efficient.

Control word meanings:

For a given control word, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 32767).
x > 0 Specifies the number of times to repeat the next word
taken from the data section (from 1 to 32767).

Note that a control word of 0 is possible but meaningless.

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead the four
bitplanes are separated, and the data within each bitplane is presented
vertically instead of horizontally. (This results in better compression.)

To clarify, data for a full screen would appear in the following order:

bitplane 0, word 0, scanline 0
bitplane 0, word 0, scanline 1
...
bitplane 0, word 0, scanline 199
bitplane 0, word 1, scanline 0
bitplane 0, word 1, scanline 1
...
bitplane 0, word 1, scanline 199
...
bitplane 0, word 79, scanline 199
bitplane 1, word 0, scanline 0
...
bitplane 3, word 79, scanline 199

Note however, that the data does not usually refer to an entire screen, but
rather to the smaller "change box," whose size is given in the frame header.

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major) [< 2]
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<Animaster Sprite Bank> *.ASB (low resolution only)

```
1 word number of frames - 1
1 word ?
1 byte maximum width, in pixels
1 byte maximum height, in pixels
16 words palette
--------
38 bytes total for header

For each frame {
1 word width of this frame (in pixels) - 1
1 word height of this frame (in pixels) - 1
1 word ?
? words image data (words of screen memory)
}

<STOS> *.MBK

9 words ?
1 long $19861987 (magic number?)
1 long offset from this long to header for low resolution
parameter block (if past end of file, no low res frames)
1 long offset from this long to header for med resolution
parameter block (if past end of file, no med res frames)
1 long offset from this long to header for high resolution
parameter block (if past end of file, no high res frames)
1 word number of low resolution frames
1 word number of medium resolution frames
1 word number of high resolution frames

For each frame {
1 long offset to data (probably only used internally by STOS)
1 byte width in words (multiply by 16 to get width in pixels)
1 byte height in pixels
1 byte X hotspot location
1 byte Y hotspot location
}

(The format implies other stuff could be here.)

1 long ["PALT" $50414C54]
16 words palette

? words of data for each frame, in the order mentioned in the
header. Monoplanar mask data follows image data for each frame.
----------
? words total

The frames often seem to be in semi-random order, not necessarily in
the order they are to be animated.

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
```

1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines

? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored separately starting with plane 0. There is, however, no standard way of storing the color palette. Some programs may save the palette in separate files, some may extend the header. For this reason, you should never assume the header is 8 words long, always get the header length from the 2nd word of the header. Also, the line width in the 7th word is the number of pixels in a line. Since the data is encoded in byte-wide packets, the actual unpacked line width is always a multiple of 8, and may be 1-7 pixels longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern length" word in the header. Repeat this pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline is to be used multiple times. Read the following record:

1 byte flag byte [$FF]
1 byte number of times to use next scanline data

The data for the next scanline follows, compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte determines the number of bytes to use literally. The literal data bytes follow.

otherwise Solid run. The value of x determines what to draw. The high bit specifies whether the pixels are set or cleared. A 1 indicates a byte-run using $FF, a 0 indicates a byte-run using $00. The low 7 bits, taken as an unsigned quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
----
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

```
If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
```

```
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk (note that "ILBM" is not a chunk ID). This is the number of
bytes that FOLLOW the 4 ID bytes and size longword. The exception to this is
the FORM chunk. The size longword that follows the FORM ID is the size of the
remainder of the file. The FORM chunk must always be the first chunk in an
IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.
```

The (decompressed) body data appears in the following order:

```
line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]
```

The FORM chunk identifies the type of data:

```
"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)
```

<MacPaint> *.MAC

```
1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
-------------
512 bytes total for header

< 51200 bytes compressed bitmap data
-------------
< 51712 bytes total
```

NOTE: The version number is actually a flag to MacPaint to indicate if the brush/fill patterns are present in the file. If the version is 0, the default patterns are used. Therefore you can simply save a MacPaint file by writing a blank header (512 $00 bytes), followed by the packed image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image. The packing method is PackBits (see below). There are 72 bytes per scan line. Each bit represents one pixel; 0 = white, 1 = black.

<RGB Intermediate Format> *.RGB (low resolution only)

This format was invented by Lars Michael to facilitate conversions between standard ST picture formats and higher resolution formats like GIF and IFF. It supports 12 bits of color resolution by keeping the red, green and blue components in separate bit planes.

```
1 word resolution (ignored)
16 word palette (ignored)
16000 words red plane (screen memory)
1 word resolution (ignored)
```

16 word palette (ignored)
16000 words green plane (screen memory)
1 word resolution (ignored)
16 word palette (ignored)
16000 words blue plane (screen memory)

96102 bytes total

The format was derived by concatenating three DEGAS .PI1 files together --
one for each color gun. The RGB value for a pixel is constructed by looking
at the appropriate pixel in the red plane, green plane, and blue plane. The
bitplanes are in standard ST low resolution screen RAM format, but where pixel
values in screen RAM refer to palette entries (0 through 15), pixel values
here correspond to absolute R, G, and B values. The red, green, and blue
components for each pixel range from 0 to 15 (4 bits), yielding a total of
12 bits of color information per pixel. Not coincidentally, this is exactly
the format of ST palette entries (although on ST's without the extended
palette only the lower 3 bits of each color component are used).

You can view a single bit plane on a standard ST by splitting the .RGB file
into its three DEGAS .PI1 components and setting the palette to successively
brighter shades of gray.

<ComputerEyes Raw Data Format> *.CE1 (low resolution)
*.CE2 (medium resolution)

1 long [$45594553 or "EYES"]
1 word resolution [0 = low res, 1 = medium res]
8 words ?
If resolution = 0 {
64000 bytes red plane, 320 x 200, 1 pixel per byte
64000 bytes green plane, 320 x 200, 1 pixel per byte
64000 bytes blue plane, 320 x 200, 1 pixel per byte

192022 bytes total
}
else If resolution = 1 {
128000 words 640 x 200, 1 pixel per word

256022 bytes total
}

This is almost two formats in one:

Low resolution:

The planes are arranged vertically, instead of horizontally.
The first byte is the red component of pixel (0,0), the second is (0,1),
and the third (0,2). The 201st corresponds to (1,0), etc. The 64001st
byte is the green component of (0,0).
Only the low six bits of each byte are used.

Medium resolution:

The picture is arranged vertically, instead of horizontally.
The first word is pixel (0,0), the second is (0,1), and the third
(0,2). The 200th is (1,0) etc.
Each word is divided up into the RGB values for the corresponding
pixel, as follows:

```
Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 B4 B3 B2 B1 B0 G4 G3 G2 G1 G0 R4 R3 R2 R1 R0
```

Bit 15 is not used.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

* Roland Waldi contributed extensive information on the following formats:

GEM, IMG, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

** John Brochu, ST picture formats guru, provided sage advice and many
corrections to the following formats:

NeoChrome, DEGAS Elite Compressed, Spectrum 512 Compressed,
GEM Bit Image, IFF, MacPaint

From: bill@mwca.UUCP
Message-ID: <1994@mwca.UUCP>
Source record: 216868

The San Jose Mercury News did run a front-page (Business section) article with a fair number of details, but expressed doubt as to Atari's chances for success given that it's neither PC nor Mac compatible.

In a separate article last Sunday in the Computing section there was a cover story about "Making your TV like a computer", stressing CD-I, CDTV, and Tandy/Microsoft's new garbage-I-mean-home multimedia player, and did have a paragraph mentioning Atari's new home computer as possessing multimedia capabilities.

Just in case it's of interest, you can still get the MS-DOS version of GEM.
I installed it on the PC I occasionally use at work, as provides me with
a familiar user interface and is not a memory/disk space hog like Windows.

In the current version (GEM/3) the desktop has been changed so that it no
longer infringes on Apple's copyright, but I am one of the lucky people who
still has a copy of the original version, which is identical to the Atari
version (except for viewing/printing files).

>so why not? And why isn't there an equivalent for PCs or MACs ? If it
>was easy someone would have made the Toaster for PC-machines long ago
>and be multi-millionaires by now. No, the secret lies in the combination
>CBM Video Hardware + Toaster HW + Toaster SW + CBM System Software.

Well, the regular STs didn't have an input for external sync, so you couldn't
synchronize with an external video source. The STe has this input, so
genlocking is easy. Of course, there are genlock boards for STs now, so
someone has obviously found a way around this lack of an input.

The PC bus is too braindamaged to support the bandwidth required to do
good video, and PC video adapters are too braindamaged to do fast good-looking
video in the first place. With the original bus at 5.77MHz and 8 bits, and
even the AT bus at only 16 bits, you can see where the problem lies.
Dunno about Macs, but judging from early architecture it's hard to see
how they could do it right. As I recall from the TT, the new video hardware
performs 64 bit memory accesses, not 32, so if you're only estimating
based on clock speed you're going to be off by a factor of two.

Quoting from the video tutorial posted in rec.video, 3 Mar 90 02:57:35 GMT:
:Composite NTSC digital studio equipment typically stores a frame as
:768-by-480 samples of 8 bits each, for about 384 KB (3 Mb) per frame.
:Component digital equipment stores YUV components at 720-by-480 samples of
:16 bits each for about 675 KB (5.4 Mb) per frame: 8-bit U and V colour
:components are horizontally subsampled by a factor of two with respect to
:luminance.

As such, your question about 24-bit video is irrelevant, and it's quite
obvious that the Falcon *can* output broadcast quality video. Character
generators are for people who don't have real computers to work with.
Dissolves and wipes between computer generated video and live video are
trivial given the external sync input. Mixing video signals requires
dual video inputs and a TBC, which the Falcon doesn't provide, but even
with a Toaster you still need an outboard TBC, so the question is also
irrelevant.

Change the '=' to a '==". ie:
if(fpath[i] == '\\')

Your code is copying a '\' over every character in the path name.

OrCAD is not a general drafting program like Claris CAD. It is specifically
for drawing electronic circuit schematics and creating netlists which can
be sent to a circuit simulator. It is available only for MS-DOS computers
and is relatively unique. I don't think there is anything comparable
available even for the Macintosh, not to mention the Atari ST.

you are assigning '\\' to fpath[i], which returns true
and thus sets count to i

you need to use == instead of =
> count = i + 1;
> printf("count = %d", count);

Excerpts from netnews.comp.sys.atari.st: 29-Sep-92 Re: Atari Falcon at
BCS Sho.. Jack W. Wine@uhunix.uhcc (1128)
> Previous calculations of memory bandwidth were based on 60 Hz vertical
> refresh so the 72 Hz means the Falcon is at least 20% faster! Also
> 800x600 at 60 Hz uses almost the same bandwidth as 640x480 at 72 Hz

640x480x72 means that there is 32MB/s of video memory bandwidth
(it could be less, but it seems sensible)

32MB/s divided by 60Hz gives you 530'000 points per image:
and it doesn't take into account the time to 'scan-back' lost
in synchronisation (typically 30% in non-overscan and more than
10% in overscan)

So that I don't believe 800x600x60 hz to be feasible in 256 colors !

Anyway, only monochrome interests me !

>as if the if(fpath[i] = '\\') isn't even seeing the slosh (backslash).
>I am using Sozobon2 (if that means anything)...

```
First of all the for loop should be:
for(i=0; i < strlen(fpath); i++)
^^^
Second: why do you do:
... count=i+1...
strncpy(... count-1) ?
Wouldn't it be easier -and more straightforward- to omit the +/- 1?

Third: if the fpath ends with a '\\' (don't know that without the compiler
handy :), then the last '\\' encountered is when i == strlen(fpath)-1
Then count should be i+1 == strlen(fpath). Right? Is this what's going wrong
or am I missing the point? Sorry if *I*'m stupid or asking the obvious...

Fourth: it looks like you're trying to separate path and filename. Why not
use strrchr, which gives you the last occurence of a char in a string?

Hi,
I was wondering if anyone out there could tell me where to find
an Atari dealer in southern New Hampshire or north-eastern Mass. I live
in Manchester, so close to there would be great. I bought a 520ST years
ago, remember when they were selling them at places like Lechmere and having
special package deals as incentives. Anyway, I sold it about a year ago
to buy an evil PC-clone. Now I want a Falcon, or possbily even a TT if I
can find one and can afford it. I have owned nearly every model that Atari
has put out from the 400 through to the 520ST. (I might actually buy the
old 520 back, since I sold it to my sister.) Anyway, the simple fact that
I am currently using an Intel machine should indicate the seriouness of my
dilemma(sp?). Please help me out.

There is a commercial program called ST Easel, that lets you put
almost any Degas picture as your desktop. You use the same program
for low, medium, and high resolutions, you just need to have the
picture in the right format (PC1, PC2, or PC3)/

The program is inexpensive, so try not to pirate it.

>as I understand it, is that when formatting a disk the ST puts a random
>number into the boot sector (that is used to detect when the disk has been
>changed), whereas MS-DOS puts a fixed number number into this location.

Well there are other reasons like some Chinnon Disk drives don't recognize
that a disk has been changed when its write enabled, ok when its disabled..

Also TOS 1.0 and 1.2 will hickup on disk changes, better to get TOS 1.4
as it had some changes to its disk change logic...

Note: the physical info that is sensed, is the drives write protect line,
this does not allways toggle with some drives when the disk is changed..

Roger..... sheppard_r@kosmos.wcc.govt.nz

```
> #include <osbind.h>
>
> ...
> for (i=0; i<nwait; i++) Vsync();
> ...
```

Sorry Claus, won't work. The original poster specifically mentioned that on an ST, his code takes more than one VBL period. So he has to either

- use two different delay loops, one for the ST and one for the TT

or - wait until the VBL counter system variable (_frclk, if I remember correctly) reaches a certain value. (This must be done in Supervisor mode).

Rough draft:

```
#include <osbind.h>

#define _frclk *((long *)...) <--- don't remember the location

long read_value_of_frclk()
{
long old_ssp, result;

old_ssp = Super(0l);

result = _frclk;

Super(old_ssp);

return result;
}

...

void main_game_loop()
{
long last_tick = read_value_of_frclk();
long next_tick;

do {

... lots of neat stuff ...

next_tick = last_tick + 3l; <-- # ticks to delay

while ((last_tick = read_value_of_frclk()) < next_tick)
/*idle*/;
```

```
} while (! end_condition_reached);
}
```

Hope this helps,
Jens.

3363. What's new with Atari?

Newsgroup: comp.sys.atari.st
Date: 1992-09-30 11:22:19 UTC
From: sward+@CMU.EDU
Message-ID: <EemTtfC00iUxE59JYG@andrew.cmu.edu>
Source record: 216906

Hey all,

The last time I knew anything about Ataris new computers was back when I owned an Amiga 1000, and comparing that to the 1040ST (I now own a 386sx). Now, when I was looking through comp.sys.next.advocacy, someone mentioned the Falcon. I'd never even heard of the Falcon until now, and am curious as to what's up with Ataris computers. If you have a good history of Atari since then (along with the specs for their computers), please mail it to me - but _please_ send it to sward+atari@cmu.edu (add atari between the "+" and "@").

Thanks!

3364. Using font LCIRCLE10 in LaTeX

Newsgroup: comp.sys.atari.st
Date: 1992-09-30 11:45:32 UTC
From: cordes@ac.dal.ca
Message-ID: <1992Sep30.084532.7864@ac.dal.ca>
Source record: 216880

I've just started checking out the picture environment in Latex and have run into a problem.

My small picture has a \put(x,y){\oval(x,y)} command. When I went to print on an SLM804 I got the message (from DVIPRINT) that font lcircle10 (note the 9 character font name) couldn't be found, so the oval part of the pic didn't print. I _do_ have a font called circle10 and also one called lcircle1 (both TFM's and PK's). It looks to me as though the 8 character filename limitation may be causing a problem here, preventing lcircle1 from being recognized as the desired font. If this is right, how do I overcome this apparently trivial difficulty?

I'd be very grateful for any advice on this. Thanks in advance.

> +5V... so be careful in connecting anything...

Well, if the above pinout is correct for the Falcon this will be a BIG gotcha. The SCSI-2 standard defines pin 11 as being at GND, and a couple of SCSI disk drive manuals I have checked at random both have pin 11 at GND. I sure hope pin 11 is not *really* at +5 on the Falcon, else almost all SCSI devices will need a special cable to disconnect that pin.

I have written a little TSR which allows you to use the 3D glasses interface to the RS232 port with the same circuit they use for the PC. I have been using them with Cyber Studio and they work great. If anybody needs a copy of this program, just e-mail me. You can ftp info on the serial interface from sunee.uwaterloo.ca. The main reason I wrote this program is because of the unavailability of the StereTek glasses and it is nice to have 1 pair of glasses that I can use on the ST and on the PCs at work.

Source record: 216886

There used to be two dealerships in N.H. White Mountain Computer
in Nashua, and On-Line in Salem. White Mountain no-longer carries
Atari, but at last check, last year, On-Line still carried them.

The other route is to call Bit-Bucket in Newton, pick out what you
want and have them ship it to you in Manchester, avoids the sales
tax. They used to have a branch store in Merrimack under a different
name. They may still have that store, so you could pick it up in N.H.

All my information, except about the Bit-Bucket in Newton, is a year old
since I was transfered to N.C. last year.

3372. Problem Formatting FirstWord files.

Newsgroup: comp.sys.atari.st
Date: 1992-09-30 13:56:19 UTC
From: davidb@muppet.bt.co.uk
Message-ID: <1992Sep30.135619.12618@muppet.bt.co.uk>
Source record: 216896

Hi chaps/chappettes,

I work with FirstWord Plus on a 1040 ST, and run files between this machine
and my Sun SPARC here at work. This means saving in ASCII format on DOS floppy.
Simple.

Sometimes, however, text files in FirstWord don't want to format. I hit the
format paragraph command, and nothing happens at all, or it maybe formats
the one line, then stops.

Other times, the format command removes forced linebreaks I have deliberately
put in, and formats page after page into one great paragraph!

These problems are particularly prevelant on files I have ferried back and
forward to the SPARC, but can happen on the 1040 with no outside help at all!

What is going on here? What does the format command look for in deciding whether
to linebreak/join or not? More importantly, how can I fix it so it always formats
properly?

Thanks for any help you can give,

David Baboulene (davidb@muppet.bt.co.uk)

|> if(fpath[i] = '\\')
|> count = i + 1;
|> printf("count = %d", count);
|> strncpy(fname, fpath, count - 1);
|> }
```

Aside from the other followups, do not forget that strncpy does not necessarily end its result with '\0'; you will have to do that explicitly with

```
fname[count-1] = '\0';
```

Hence:

```
re_name()
{
char * strrchr();
char * bSlash;
int count;

bSlash = strrchr(fpath,'\\');
if (bSlash == NULL) {
/* No '\\' in fpath */
printf("count = 0");
????? copy -1 characters ?????
} else {
count = bSlash - fpath + 1;
printf("count = %d", count);
strncpy(fname, fpath, count - 1);
fname[count-1] = '\0';
}
}
```

Well today marks 5 weeks from the day I ordered from Toad Computers.

I had heard only good things about this company. I seriously doubt I will ever order from them again. I ordered a hard drive case and 2 lynx games, all of which I was told were in stock.

Maybe there is some problem that is beyond their control?

I will not waste my time and money phoning them to check on this order.

Anyway, consider this a public service announcement.

(If anybody who lives in a local exchange to Toad would like to phone them and check on the order, I would appreciate it.)

In your tiny "user's guide" there is a pinout for the Midi out/thru port.
The standard three pins (1, 3, 5) are signal & shield and (2,4) are thru.
Use pin 3 for the shield, there is no harm since the devices are allegedly
isolated. By the way, unshielded works fine for me over short distances.

Regards

How about we wait until the machine is in our hands?! If by some catastrophe, the Falcon never makes it onto our desktops, or there is some unforeseen delay, we would look pretty silly with our newsgroup for a non-existent computer!

I know this is pesimistic, and of course it's just an opinion, but perhaps for the time being, a kill file entry would be more prudent.

Source record: 216912

```
1. Going into Supervisor mode is easy : just call GEMDOS:

void *oldsp;

oldsp = super((void *)0);

oldsp will contain the address of the user stack pointer. You will now be
in supervisor mode. Just make sure to get back to user mode before your
program exits (Or GEM will go kablouie!!!)

super (oldsp); will do that for you.

2. to get n vbl's, you should simply call XBIOS:

Vsync(); will wait until the next vbl occurs.

Hope this helps.

Patrick.

32Kwords to be precise, with 24 bit each, so the falcon's memory
is 96Kbytes. Also, if I remember well in this month's issue of
ST-Computer I read that the whole SRAM can be accessed as P-RAM,
while X-RAM and Y-RAM use the _same_ 32K, but X-RAM from $4000-
and Y-RAM from 0-$3fff. Which means, that all SRAM can be used
for programs or data (or both at the same time).

I would wait about nine months before actually proposing that such a newsgroup be formed. That should be enough time for the owner-base to become large enough that Falcon-specific postings will no longer be of interest to non-Falcon owners. It will also give enough time for us to determine whether the Falcon-specific message traffic is sufficiently large enough to merit its own newsgroup.

The Falcon is not a big jump in machine/OS from the (Mega) ST/STe/TT, certainly not as big a jump as Atari 8-bit to Atari ST. Give the machine time to actually be purchased before considering a separate newsgroup.

>> Previous calculations of memory bandwidth were based on 60 Hz vertical
>> refresh so the 72 Hz means the Falcon is at least 20% faster! Also
>> 800x600 at 60 Hz uses almost the same bandwidth as 640x480 at 72 Hz
>
>640x480x72 means that there is 32MB/s of video memory bandwidth
>(it could be less, but it seems sensible)

Well I did calculate it this way:

Hoped for (at least) buswidth total = 32bit * 16Mhz = 64MByte/s.
Why do I assume this ? Well the 030 is 32bit wide and runs at... 16Mhz.

Known values from Quick Index 2.2 (taken from c't Magazine #10)

640x400x?Hz monochrome: memory 478
640x400x?Hz 256 colors: memory 362

I just guess that memory writes to the bus and checks how fast RAM
can be accessed.
I assume also Hz is 60.

Videobus needs: monochrome 640x400x60/8 = 1.92 MB/s (1 color = 1 bit)
color 640x400x60 = 15.36 MB/s (256 colors = 1 byte)

Cpubandwidth left (mono): 64MB/s - 1.92MB/s = 62.08 MB/s
(color): 64MB/s - 15.36 MB/s = 48.64 MB/s

Quick Index, CPU speed loss: 478/362 = 1.32
My calculated speed loss : 62.08/48.64 = 1.27

(If the Falcon had 128MB/s we would expect a factor of 1.1 and
with 32MB/s a Factor of 1.8)

So I'd guess we can assume that the bandwidth of the Falcon System
is around 64MB/s.

So if you don't care what the CPU is doing, theoretically you could
get a little more than 1200x700x72Hz with 256 colors out of the Falcon bus.

Nat!

3390. Re: comp.sys.atari.falcon

Newsgroup: comp.sys.atari.st
Date: 1992-09-30 20:34:09 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <69480@hydra.gatech.EDU>
Source record: 216900

How about changing comp.sys.atari.st to comp.os.tos? Atari machines
account for a small user base which makes a sys group for each model
unnecessary. Besides, nothing really exciting is happening for the
ST, the future for Atari computers (right now) is the Falcon.

Hell, my dad brought me a cutout from the NEW YORK TIMES that announced Atari had unveiled the Falcon at the Boston Computer show. It was a UPI article (or maybe it was AP... I think actually it was AP) and not very descriptive, but it was there in the business section! It was last sunday's paper.

3392. Using the ST with an Alesis SR16 drum machine

Newsgroup: comp.sys.atari.st
Date: 1992-09-30 21:26:35 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.717888395@cwis>
Source record: 216907

I just recently bought an alesis sr-16 drum machine, and I was happy to see those two beautiful ports on the back ... MIDI ports. I am unsure of the software available on the st that I could use with this drum machine. I would like to be able to at least store my patterns and songs on the computer, but I would love to be able to do sequencing on the computer (st controls alesis) and sample playing (alesis controls st).

Any recommendations? I would love to be able to hook the alesis up to control a tracker ... can Audio Sculpture do this? (by the way, can audio sculpture be used on a hard drive?)

Later

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:CLI:
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4

```

:GDOS:
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.2.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)

Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG

U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME

SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?

=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN:
Is there a version of XWindows for the ST?
==

Currently, there is no XWindows port for the ST. It is quite unlikely that there will be one, although you are free to port it if you like :-). There does exist a port for the TT (and presumably Falcon) as part of Atari's Unix distribution.

:DEMOS:
Why won't demo x run on my machine?
===================================

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
===

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you

first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

archive.cs.ruu.nl [131.211.80.17]

:TEX:
Is TeX/LaTeX available on the Atari ST?
===

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the

atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

3394. Direct-to-Disk Recording?

Newsgroup: comp.sys.atari.st
Date: 1992-09-30 21:38:11 UTC
From: hjwulfso@unix.amherst.edu
Message-ID: <BvEurn.3As@unix.amherst.edu>
Source record: 216909

The sound capabilities of the Flacon030 sound impressive. Is there
any software available to make use of the eight 16-bit audio channels for
direct to disk multitrack recording (a la Digidesign's Pro-Tools)?
Also, can a falcon be used as a real time signal processor for musical
applications (i.e. guitar effects, reverberation, etc...)? These two
applications would be well worth the price of the Falcon.

Oh, I dont think you should use such a cable because it doesnt follow
the MIDI-standard specification. I used such a cable with my Atari and
got problems.
I am though interested in obtaining an accessory that does the soft-
thru job for me. Can anyone tell me if there is a PD implementation
somewhere ? I cant find anyone at Atari.archive.

I have a friend in the NJ area selling a MEGA II w/Color Monitor. No
software. He works as a programmer and had to test a program one day
two years ago and bought the system for that one thing. Since then
it has been in it's box.

All offers being taken on this system.

From: EENG6826@RyeVm.Ryerson.Ca
Message-ID: <92274.182318EENG6826@RyeVm.Ryerson.Ca>
Source record: 216927

I need to keep a large collection of text files on floppies. I
tried using Revenge Document Displayer and ICE Packer v2.40, but
the compression isn't as good as with the latest version of LZH or
ZIP. Is there a program that can scroll text files read directly
from ZIP or LZH ? Without uncompressing the files first.
Thanx.

While there are no fireworks on the Generic "ST" platform. We must
remember that the Falcon is after all an ST as I understand it.
This would be the same as saying to Quadra users that you are not Mac
users.

Thats just the way I see it.
A hopefully soon to be Falcon user.

>Use pin 3 for the shield, there is no harm since the devices are allegedly
>isolated. By the way, unshielded works fine for me over short distances.

In my tiny user's guide :) the following diagram is given:

3 * * 1 1: THRU transmit data
5* * 4 2: Shield ground
* 3: THRU loop return
2 4: OUT transmit data
5: OUT loop return

It looks as if this is not the same as what you write. Or do I miss the point?
Doesn't this mean that 2=shield (obvious :) and 1=THRU? (dunno what this
'THRU loop return' on pin 3 means...)

What kind of problems are you having?

I don't think it's FZDT that's the problem.

I use it on two different UNIX sites. On one VI works fine, on the other
the scrolling doesn't work properly. Therefore I have to assume it's the
the term setup at the site itself that is the problem.

I also have scrolling problems on another Unix site, with an editor that is
NOT VI, again, the term setup at the site must be the problem.

> get a little more than 1200x700x72Hz with 256 colors out of the Falcon bus.

> Nat!

As I just don't know anything about Falcon insides, I can't
be more affirmative. But, assuming 64MB/s bandwidth is not
that easy. And your computation may well be completely wrong.

In fact, main memory (made of DRAM) is not straightforward
to use: it is accessed it two steps, it has to be refreshed and the two
steps access may be partly reduced to 1 step:

The 2 steps are:
select the row (using the half of the address bits (typically the higher half))
select the column (guess with which part of the address)

But once selected a row, you can select several column addresses in that
row: a full access is 80ns for 80ns DRAM, a 'half' access is about twice
as fast. Between each access, you have to wait for about half the time of
the access (for the memory to 'recover')
So that a read cycle can't be shorter than 40ns+20ns=60ns with a
80ns DRAM (and without taking into account the row selection)
Which gives you an absolute upper bound on the bandwidth.
16Mhz means ~66ns cycle time: so that 64MB/s is inbound.

So it seems that 64MB/s is possible on localised access (typically
video). But the CPU has random access, so that unless burst mode
is used, the memory bandwidth is considerably decreased. Anyway,
every time the 'user' changes (from video to CPU, f.ex.) a row selection
is necessary (that's 40ns added)
If this 'page mode' (that's how it is usually called) access is used,
4 accesses are typically done each time: 120ns for the full access plus

3 times 60ns = 300ns for 4x4=16 bytes.
That gives you: 16/(300x10^-9)=53.33MB/s total bandwidth

I don't think you can go much further than 53MB/s in reality
But with 53MB/s on video, your CPU is just frozen !
That's why I don't think that you can get much more than 32MB/s
video in normal conditions.(unless they use faster memories,
60ns or less)
You may have better graphics modes for displaying an image.
But that's about all: even for animation, the CPU has to do some work
(a lot of memory work in fact)

Anyway, with 4 grey levels, 32MB/s is about 128Mpixels/s
That's quite enough for me ! (about 1 million pixels)

Stefan

-- On the average, people seem to be acting normal --

3406. HELP!! Do I have a virus or a sick ST?

Newsgroup: comp.sys.atari.st
Date: 1992-10-01 02:47:46 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1687213282.C556212@mizzou1.missouri.edu>
Source record: 216920

I have been trying out the newest version of Chameleon on my 520 ST and since it runs the control panel (a desk .ACC I usually live without) I have changed the background of my desktop from green to black. Well, now I have all these little white flickers that show up on my screen. (Only on the desktop, my Uniterm black screen is fine.) If I make a box around any open area, the little dots become permanent as the pointer or frame pass over them leaving a "hole" where they were. If I change the screen back to bright green the flickers are not seen, but a green just one "click" of brightness lower and the things show up again!!! Also, I bomb out if I run some programs such as Word Writer (the first program I ever bought in 1988, now running off my hard drive) and sagrotan dies if I try a memory check (or at least that is what I thought I was clicking on. I don't speak german, so I'm not sure). Uniterm seems to go fine, but the menu from right-click leaves off the bottom few cells occasionally.
Please help me.....

[...stuff deleted ...]

1st Word uses a "variable" space character that can be "stretched" for
reformatting. The variable space is hex 1E, decimal 30 which is not the
same as a standard space (hex 20, decimal 32) that the SUN will insert.

To fix this, REPLACE " " (space) with "Control-6" throughout the
document. This should allow you to reformat the document.

> ST was being repaired and was amazed at how much faster the
> printing was...
> Thanks,
> Gerry
> ggreenbe@rodan.acs.syr.edu

Printing speed was quite slow in the previous version. I did some
experimentation and found two bottlenecks in the code. One was buffer
size. The page is 'banded' out to the printer, and the larger the buffer
that holds a band, the shorter the print time, as the page needs to be
drawn (and clipped) into each band. Bigger bands=less redraws=faster
printouts. The second bottleneck was in the 'dirty-line' detection
code. A band is broken down into several 'passes' of the print head.
If a 'pass' has no black pixels, you can speed up printing by detecting
this and giving a line feed instead of printing thousands of white pixels.

The first concern is addressed in the new version: the buffer size is
user selectable. The second _may_ be dealt with. I send my suggestion
for dirty line detection code to the authors about six months ago.

My father stole my deskjet, so I haven't been able to time the new
driver yet.

I'll happily send you the .hqx file so you can try it out. Just ask.

The DeskJet driver I recently mentioned also works with HP laser printers.
The reason is that they all use the same PCL language. Older laser
printers lack the graphics compression capability, so there is a check box
to disable compression for compatibility. The HP LJ IIP should have
at least PCL Level III, so the deskjet driver should work fine, allowing
you to print at 300 dpi.

>
>Jack
>

I'm a one of the most talkative Amiga users, but
I just wanted to say that I'm waiting to see what the
Falcon will be like becuase of the DSP and such.
The Amiga 4000 looks super but it seems that
Atari hasn't been making systems like crazy which is a
blessing in a way becuase if you look at me, I have a
3000, 6 megs and a 68030 and now the 4000 is selling around the
price I bought my system, and I can expect this one will
be extinct in several years.

Anyways.. To show you how much of an Amiga user I
am, I am listening to Todd Rundgren's Anthology and

I'm multi-tasking all sorts of stuff. But I want change,
and it could either be selling my Amiga and getting a PC or a
Falcon (or two).

Anyways (part 2)
You left out Delta-Compression on the animation stuff,
becuase delta compression will make your animation
speeds faster.

Now, about 256,000 colors, I bet the A4000 only does
that in hires-lace which is 640x480. I know PC cards
that will do this resolution... It is no big deal.
24-bit color will allow 640x480 resolutions with 256K
colors, so I suspect that the A4000's graphics system
is like this. But I bet the Falcon could handle
30fps animations if it can handle 30 megs a second,
but of course you have to figure in things like
drive access, transmission speeds, etc. However,
if the Falcon will come with that MPEG card that
I have been told will be available, then you
should be able to get data speeds of 30 megs a second.

I'm no rocket scientist, but 30megs per second seems a little
unrealistic becuase my 3000 with its 16mhz 32-bit
bus can hardly do 1 meg per second from the hard drive,
so it is probably just a hype-figure that companies
like CBM shoot out just to get more customers.

I know, I even heard from a PC user that the local bus systems could do 66mhz
on thier bus. That is unrealistic since the ram is probably
not fast enough move its data that fast and the CPU is probably
not fast enough either. I heard a quote of something like
33 megs per sec is how fast a RISC 6000 could move memory.
And a Amiga 3000 with Page Mode ZIPS can only move 3.3 megs per sec,
or something like that.

But i.link _can_ do.

They offer a software product with the DSP and a litle box as hardware.
Data modem 2400 bps (be expanded soon).
You can phone out of every app.
You can do fax in display postscript.
Digital answering equipment.

i.link GmbH Tel 030 - 2162048
Nollenbergdorfstrasse 11-12 Fax 030 - 2158274

Ya... True...
But, I don't see any PC's that use a Motorola DSP. Do you???

Do you think there will be a sound board available for the PC's
that will cost less than a few hundred dollars that will be able
to samples at 16-bit resolutions, with 44khz sample playback.
Do you think anyone will make software for it like the Soundblasters
are??? By the way, the soundblasters don't have the capabilities
to create 16-bit sound. It is all 8-bit DAC's...

Well, you do get about 20 4-op FM voices, but I would rather
buy a second hand Yammaha MODULE. I already have a MT-32
with my Amiga 3000 and am thinking about getting a sampler
with for my system. But nowadays I think about getting a lot of
things... ;-)

I probably see the PC the way you do...
But, I guess we should just wait and see..
If not, we can get a PC on the side and wait for

a Falcon.

I heard it was supposed to come out in October.

If not, I'll forget it and go on and buy a 50mhz 486 with all the fixins. I'm not going to be foolish to go off and buy another CBM product which CBM prices high compulsively.
Did you hear that when the Video Toaster became more famous CBM got cute and raised the price of the machine that the Toaster would work on ONLY, the Amiga 2000, from 1200 to 1700. The thing doesn't even have a 68030, and CBM has the nerve to do something as stupid as that.

Well the pyschic advisors in Santa Fe are even more stupid, but CBM and them have a lot in common. They all try to insult our intellegence.

>and it doesn't take into account the time to 'scan-back' lost
>in synchronisation (typically 30% in non-overscan and more than
>10% in overscan)

Taking account of the 20% overscan would mean 768x480 @ 72 Hz and that takes about 26 MB/s. Also the bandwidth of the monitor must be greater than the computer video bandwidth because, as you point out, the monitor has to respond to overscan and sync signals, while the video bandwidth of the computer is only used when memory has to be accessed (during overscan but not during sync).

>
>So that I don't believe 800x600x60 hz to be feasible in 256 colors !

Since it would only take about 2 MB/s more bandwidth than 768x480 72 Hz it seems possible! It would have to be on a multisync though and the specs mentioned that the overscan was programmable so it could be adjusted for particular monitors.

>
>Anyway, only monochrome interests me !

Something close to TT rez would be nice to show off Mono Lisa GIF! :-)

You are reading a message from a guy who could really give a
sh*t which system he was working on. I own an Amiga,
I work on PC's and a UNIX machine all day long, and doo
all my reports ona MAC II. PC's are actually beating the heck out
of Amiga's and ST's, I'm sure of this.. But the thing is is that
there will be more software developed for a specific basic
configuration than for a system that has no basic configuration.
What I'm saying is that if the Atari Falcon comes with a
DSP like everyone talks about, it will make it the first
computer in its class to use a high-quality Digital Signal
Processor. I'm interested to see what kind of real-time
reverb effects programs will appear in PD, aren't you???

Well, if I had a choice, I would get something that
could have the expandability of a PC (with an EISA, ISA and Local
Bus set of expansion ports), the crowd of enthusiasts and shareware
developers that the Amiga has, the quality of hardware and software
that the MAC's have and the price that Atari has.

By the way, I know a guy who just bought a 3000 recently, Ex-ST
owner for many years. 6 months ago he was pro-ST user.
his brother had a Amiga, and my friend wanted to get one too.
So he got one. I had him look at Deluxe Paint III, and he was thrilled.
Then I told him that I had seen copies of DPAINT III going for
under 40 bucks. Talk about Future Shock. Now, GVP has a
piece of software called CINEMORPH that does exactly the kind
of MORPHing effects that are used in some TV commercials and
of course were used in Terminator 2. Look at the most recent Amiga
World to get a taste.

Now, you don't have to have a 3000 to run this software.
Just a 500, about 8 megs of ram, which is like 300 bucks,
maybe a 68030, which is another 300 bucks, and a hard drive,
to make it useful. The total system cost you would need is about
1000 bucks, but you could do it with a system adding only
4 megs of ram. Now, since prices are getting so low, I might
sell my 3000, get a 500 and a 25mhz 68030 (by the way, I saw that the
68040 upgrade for the 500's is going for 1000 dollars).
Now, then I get a Falcon, and a Local bus based 33mhz 486.

See the smile on my face??

It ain't a matter of pride, but a matter of what can be done...

Being a mono-computer-user is like limiting your capabilities.

But the reason I'm into everything is becuase I'm a
computer AIDE that is working 20 hours a week doing
nothing but helping others with thier UNIX/MSDOS/MACOS problems.
And don't I just love to play with my 3000...
I like PC's for video games... but they have other uses...
I'm sure!!

ST's would be great for me too.. I have 2 MIDI synths
and a Piano. I would love to get a sequencer for the ST's
(since they are so cheap, it is amazing) and would probably
be a point in getting a ST or a falcon.

But as I see it, everybody that limits themselves to just
one computer is not being realistic. I could
look at the market right now and say that just
about everybody is doing well.

Amiga programmers are writing much better code that will
not crash.

PC developers are making super graphics cards that
can display 32K colors from 2^24 palette, for almost
nothing.

Atari is fixen to come out with a Motorola DSP based computer
that sounds like it will cost under 1000 bucks, which
opens the oportunity to many starving programmers to
write super DSP-based code.

MACs now come in laptop form and are getting easier to setup
and live with.

UNIX is the same'ol thing but everybody I know, wants to
learn more about it, while most do wish they had a
friendlier system. It is healthier for users to get
this kind of experience becuase they depend on GUI's
so much that some day they will have to use
some form of CLI, or they will be fired. About 90%
of everything is CLI based. Besides, you can't do wildcards
ina GUI. You also can't alias a bunch of commands that
do several jobs as one. A mouse is intuitive, but is by no means
faster. But I'd let you decide on this issue. It depends on
what you do...

Well later

3417. Re: Boston Computer Society shows Falcon 030

Does anyone know about a 768x480x65536 colour mode on the Falcon ? There is one according to a information sheet given out by Atari at their stand at the European Computer Trade Show. I don't think its a typo as it's referred to twice in the sheet, once in the main text and once in the technical specs. The actual wording in the main text is "The top resolution in true colour is 768x480". Does this imply that higher resolutions might be available in other modes

> Also, can a falcon be used as a real time signal processor for musical
>applications (i.e. guitar effects, reverberation, etc...)? These two
>applications would be well worth the price of the Falcon.

Yes to both questions. The Falcon will ship with two rudimentary
programs to do this. One is the D2D program that will record audio
samples direct to disk (one channel stereo) and allow you to edit,
splice, etc. the waveforms. A hardware expansion will be needed to
make use of all 8 stereo channels (in/out). D2D will be very
rudimentary and commercial programs will folow.
Another program, the Audio Fun Machine, will use the DSP to do
delay, reverb, distortion, surround sound ambience, etc. with filters
and a software equalizer in real time.

I'm sure more elegant and feature filled programs will follow.

Sorry, but I think you made a mistake!

The MIDI outport has its MIDI-OUT signals on the normal pins (for MIDI),
thus 2,4,5 (2 is GND), leaving 1 and 3 for THRU.

>to linebreak/join or not? More importantly, how can I fix it so it always formats
>properly?

Having the same problem, I found a way around!

Taking an ASCII file home on floppy (using MTOOLS on sun-sparc)
needs a little program to convert ASCII spaces into "soft spaces" used
by First Word Plus.

There is such a program in atari.archive
I do not know the program's name by head, so let me know
if you need the name.

That program works quit nice as long as you do not have spaces at
the end of a line (in the ASCII file), as well as having the alineas (english?)
separated with empty lines.

Back to Sparc:
This needs the ^M removed at the end of the line at the sparc.

The way I do it is simple:
As soon as uploaded to the sparc I mail the file to myself,
as our mailtool does just that.

Hope this helps.

John

>send faxes with it... but I have no atari FAX software. Is there some
>(public domain or else) available? Where? At what price?
Last weekend I saw a demonstration of the QFAX Pro software. This is really
great. They deomstrated it with a Zyxel higspeed fax modem but assured
me it could work with any. It uses printerdrivers to connect to other
applications, so you can print from Calamus, That's word, Megapaint
etc. etc. etc.
It comes with a lot of drivers for different programs and different
modems. While faxes are send they are in a queue and you can still go
on working. So multiple faxes can be send after another without having
to wait.
Also sending of one fax to several numbers is possible. You can also
import faxes made by BitFax (for IBM PC's and compats)
that's it as far as I can remember.
Price was Dfl 125,- which should be around $70,-.

Erlend.

Try to install the control panel separately - so put it in C:\ and don't use
Chameleon to load the CP. They don't cooperate too well. I mean, you *can*
use Chameleon, but not for the CP. This is just a guess, but I remember having
tried to load the CP with Cham once, and encountering difficulties.

You expect we'd know better than they would?

>I will not waste my time and money phoning them to check on this
>order.

So instead you waste our time and the net's money? Look, if you're too
cheap to call, send a postcard. Even the best companies make mistakes
sometimes. What if they've already shipped your order and the shipping
company misplaced it?

>Anyway, consider this a public service announcement.

I consider it useless whining. Don't complain, contact Toad! I've
always had excellent service from them.

[...stuff deleted ...]

Over the past three or four years, I have placed three orders with Toad Computers. The two hardware orders both ended up being returned because of Toad-induced problems. It cost me return shipping both times, but in all fairness, I consider the resolution of the problems to be acceptable (if not entirely satisfactory).

The software order had no problems (other than putting up with some minor over the phone rudeness while placing the order).

All in all, I will not be in any great rush to order from Toad again, but I have never been "ripped off" by them.

I have received much more friendly and reliable service from D&P Computers (in Ohio, I think) and from E. Aurther Brown.

My $0.02 :-)

Anthony, the people at Toad Computers _are_ good folks and I feel it quite unfair to blast them like this without even trying to contact them about the delay in your order. Mistakes happen to the best of us so at least give them half a chance to make you happy before condeming them, OK?

I don't live anywhere NEAR the D.C. area but I'll call them for you and report back on what I find out.

You might also consider Tiger Cub from Dr. T's and, if you can find it, M by Intelligent Music (which is now sold by someone else I think).

>
> > and sample playing (alesis controls st).
>
> I don't think I quite undertstand what you have in mind...

I'll take a shot at this one:-). I think you mean to be able to have the drum machine play the ST using samples or the internal sound chip. I don't know if the SR16 generates MIDI note-on and note-off events - there was a program on an old _STart_ magazine disk that would display incoming MIDI data; that would show if the drum box outputs note messages. If it does, then you can do what you want (perhaps).

There are at least two (three now perhaps) companies that sell sampling cartridges and software. I think they all can play a sample based on incoming MIDI note messages. To find these products, you'll need to look in a store (unlikely here in the US:-) or search the mail-order houses (especially in Europe). ST Replay is an example of such a device.

Note that if the SR16 does not output MIDI note messages (and a lot of drum machines don't, but I don't know about newer models - I cannot afford new equipment in general:-), then you SOOL on this one.

Have fun (and I hope I've helped)! - Bob

Message-ID: <1992Oct1.153141.7579@cs.hw.ac.uk>
Source record: 216812

The latest (November) issue of the UK publication Personal Computer World has a three page article about the Falcon in it. Chris Cain gives it a very favourable review. The machine he had access to was a production machine belonging to HiSoft and it had the new desktop etc. HiSoft's new art package for the machine, TruePaint, was mentioned along with other software that was available at the time.

There were also two 256 colour screenshots of TOS 4.0/GEM in action but sound seems to have been considered the most impressive part of the machine.

Now that we've seen a review of the Falcon in PCW perhaps Atari UK should consider putting an advertisement in there too. Peter Staddon never did so perhaps Darryl Still will ...

>Simple.

>Sometimes, however, text files in FirstWord don't want to format. I hit the
>format paragraph command, and nothing happens at all, or it maybe formats
>the one line, then stops.

The reason for only formatting one line is the "hard" carriage return that exists at that point. You can remove this by positioning the cursor at the begining of the line pressing backspace (to delete it) and space then reformatting with the F10 key.

>Other times, the format command removes forced linebreaks I have deliberately
>put in, and formats page after page into one great paragraph!

A bug I am afraid - There is a workround, the line has to be non-blank, but I can't remember the details.

>These problems are particularly prevelant on files I have ferried back and
>forward to the SPARC, but can happen on the 1040 with no outside help at all!

>What is going on here? What does the format command look for in deciding whether
>to linebreak/join or not? More importantly, how can I fix it so it always formats
>properly?

Another tip is to do a search and replace (over the whole document) of the space character ie replace space with space. This converts all the "hard" spaces into soft spaces that Wordplus uses. I believe that words are denoted by the last character in the word having the 8th bit set. This happens when (in WP mode) you type the space character.

Here in Germany you can buy the ZyXEL U-1496 with the commercial
software called QFax/Pro. It is an accesory which allows you to send and
receive FAX in background.
The software alone costs about US$99

3439. New Mac Prices tough on Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-10-01 18:22:53 UTC
From: bernardo@erevax.bitnet
Message-ID: <bernardo-011092142428@126.10.4.34>
Source record: 216803

Here is a portion of a recent press release posted in
comp.sys.mac.announce.

Previous SRP New SRP %Change
Macintosh LC II(4MB/40HD) $1,699 $1,239 27
Macintosh LC II(4MB/80HD) $1,849 $1,349 27

It seems to me that Atari would have a hard time marketing the Falcon with
similar configuration for ~$1300 as I've read in this newsgroup.

Marcelino Bernardo
bernardo@erevax.bitnet
Usual disclaimer applies.

"loop return" - a MIDI network is based on a current-loop serial interface. Instead of using different voltages for signaling, presence/absence of electrical current is used. So, in order to have a current flowing, you must have a complete circuit, which implies, if you are sending current out, you must have a place for it to come back to. Thus, "loop return."

What I also didn't take into account is that maybe the processor and the video RAM is interleaved (like on the ST) in some way. Still... the 68030 does apparently slow down, when I higher resolution. So the interleave can not be like on the ST fully transparent (as far as I can see. I am neither a mathematician NOR an electrical engineer).

>Also, I believe the mysterious dissappearance of 2 meg of memory (expandable to 14 meg?!) is due to the fact that Atari is using this memory as VRAM.
Mmmh, my guess would have been that this were ROM and I/O chips.

If it is tru that this pin is at +5V, I don't think is is wired directly
to +5V, but instead via a resistor of some kind. Gounding it will
probably do no harm at all, but......

Actually, the TEC was developed by a German company (sorry, forgot the name offhand) and Codehead is primarily acting as a distributor.

>safe.

Btw, if you have an STe, you only need the new chips, you don't need the expansion card at all. In the TEC kits that Codehead sells, you will need to do some extra soldering work if you want to be able to switch from 2.06 back to an older TOS. Best Electronics now has a competing product that has the switch already made, so you may want to compare the two. The TEC comes with a utility disk of stuff for TOS 2.06, I don't know what the Best kit comes with. (And I haven't actually installed 2.06 on my systems yet, so I haven't looked over the utilities disk...)

If your ST already has a socketed CPU (e.g., if you had some CPU accelerator installed) the installation will be much easier. Also, the newer boards from Fast Technologies have sockets for the 2.06 chipset, so you won't need a TEC if you get one of their accelerators. (I'm seriously considering this; if anyone would like to buy a used Turbo-16 board, please e-mail me. I have all the documentation of course; installation would be up to you...)

Anyone know a number for customer service at Atari in Sunnyvale, or for
their East Coast/Canada office? I called a number recently posted here
for Gail Bacani (sp?) and was informed the number was disconnected.

Hi!

There are sevral prgs to do the job. A good choice is "gemview".
You can get some convert-prgs via ftp from "ftp.tu-clausthal.de" (139.174.1.3)
Get /pub/atari/graphics/convert/Index ....

Bye,
Wolfgang.

>>
>>Maybe there is some problem that is beyond their control?

One "obvious" thing that comes to mind: Customs & Excise? This STuff has to cross the border, and the Canadian Feds. have been setting up a variety of regulations to try to stem the flood of "cross-border shopping." I would be totally unsurprised to hear that the STuff is sitting at Canada Customs, and that you'll be hearing from them soon, asking if you want to:
a) Come down and pick it up (800 miles away, more than likely)
or
b) Pay a customs broker to pick it up and ship it on to you.

This used to commonly happen with stuff shipped by UPS; the latest GST extraction regs. are starting to apply this sort of thing to stuff shipped by regular post too...

A few years ago I ordered a bundle of aged 8-bit stuff on clearance, and wound up paying more for the brokerage fee than I paid for the actual goods themselves. (Still was a reasonable deal, tho!)

>I'm using ghostscript 2.41b and have a problem with my deskjet:
>With some postscript files there is a little bit at the end of the
>page missing, it does not print in the lower 3cm of the page (DIN A4)
>On the screen I can preview to entire page.

This is a common problem, so I might as well post the response. This problem can be fixed, but the details will depend on your setup. Before getting into the fix though, I want to mention that most of the drivers in GS 2.52 (I have the 2.52 port done, but am testing it and making some improvements) can be told to use A4 and other paper sizes (the default is 8.5x11). This might help the situation (but I am not sure).

For some odd reason the deskjet driver does not seem to behave the same on everyone's printer, so I can't seem to fix this problem once and for all. I fix it so that it works on mine and that is all I can do. One common problem is that differences in the dip settings (do you have the printer set to perf skip mode?) can affect the output.

If turning off perf skip doesn't help, there are a number of other solutions:

1) Run GS with no input file. At the command line prompt, type
GS> 0 85 translate
GS> (file.ps)run

This will move the page up 85 printer's points (1/72 inch), which is about 3cm. You can play around with precicely what numbers give you the correct output. This only works if file.ps is a single page document.

2) Create a file called, say fix.ps, with the "0 85 translate" line in it. Then invoke GS as follows:

gs -sDEVICE=deskjet fix.ps file.ps

Again, this only works with single page output. You can edit gs_init.ps to load fix.ps automatically on start-up, but if you want to do that, you should probably use the following fix, which was sent to me by Craig Servin:

3)
edit the file gs_init.ps
find the section that looks like this

/initgraphics {some junk } odef

and make it look like this

/initgraphics { some junk 0 36 translate } odef

all this does is moves the origin up by 1/2 inch(36 points) and since initgraphics is called after every showpage it works for multiple page printouts.

I hope this helps those having these kinds of problems.

>as Extend-O-Save, an AfterDark-like modular screen saver. The instructions
>for making your own modules can be freely distributed.

I'd like to take a moment and put in my $.02 about Warp9. On the
whole, it is good but as a TT user, it has some shortcomings. If anyone
out there has some (constructive!) suggestions for them, I would appreciate
advice.

I have Warp9 ver3.70 ("with Extendo-save!" :)

I purchased Warp9 at the recent Glendale Atari show (unfortunately,
since then, I have managed to lose my registration card :( ). Warp9 works
in most respects except for:

1) in some applications (ex. Connect) it places a blinking cursor
in the (usually) upper left-hand corner.

2) It does not read the warp9.dat file I have placed in the root
of my c:\ drive (even with the .acc installed too). This shows up most
annoyingly when I try and play PopulousII - the screensaver goes on five
minutes into the game. I have tried several ways in the warp9.dat file:
"pop2.tos ", "pop2.tos s0" and even "pop2.tos s0 a0 m0". Unless I manually
turn it off, my populous gets trashed.

3) I don't like the fact that I can't load a .pc3 file into my
TTmedium rez, or a .pc2 for that matter. Also, I don't have access to
prism paint so there are no utilities (that I am aware of) that will convert
anything (but especially GIFs) into any of the TT resolutions, which is what
I am in most of the time. BTW, it is almost amusing to see a .pc1 loaded
as the backdrop in TTmed - this picture covers...the entire left/upper
quadrant of the screen :). This would be cool if you could at least tile
the picture over the rest of the screen...

Other than that, Warp9 does significantly speedup screen output,
and when I am in ST modes, the backgrounds are nice! :) Oh, the ability
to replace the fonts is ESPECIALLY nice (and not as slow as GDOS). Of
course, I have yet to see any other extend-o saves work (other than screen
blank) but as I said, I don't spend much time in ST modes.

3459. ICD link

Newsgroup: comp.sys.atari.st
Date: 1992-10-02 06:05:17 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <Oct02.060517.52341@yuma.ACNS.ColoState.EDU>
Source record: 216821

Well, our local dealer got the new ICD Link in stock three days ago, so I bring my Toshiba 3301 CD-ROM to the store to see how the new link and ICD software works. (The Metados 2 as supplied by Atari does not work with the 3301)

The Link did looks cool, it's just like an adapter of some sort(like the serial port gender change in size) one end has the DMA connector (a DMA cable comes with the package) and the other end is a male SCSI connector(ready to plug into typical SCSI drive). The software boot is version 6.0.2 and besides the new cd-rom software there is a program call eject (the doc said it eject disk from those floptic drive).

Anyway, the ICD version of Metados installed itself at boot time with some strange behave (ICD said they will have it fix right now so I won't go thru that.), but the 3301 did installed as two logical drive -- one for the old IBM type format and one for the ISO standard format. (The Mac HFS format is not support, so I guess the Spectre won't see it either, but I did not try that yet to be compelete sure about it). Insert an IBM format type CD-ROM in the drive and click on the icon for the IBM format drive. The content on the CD-ROM shows up just like the hard drive and read the text file without any problem. Copy binary file also seems to work (of course we cann't run those IBM binary files) We then tried an ISO standard type disk, it also works just fine. The Mac develope disk (Mac HFS disk) doesn't work (just like ICD has said, but just want to try anyway).

However ICD say currently there is no application that would use the CD-ROM nor provide control to play audio CD in the CD-ROM drive.

The Link looks very good and the software seems to do what ICD said, so should be a good product. Just some of my short hand-on experience.

Source record: 216824

Hello world,

Is there somebody out there who has experience
in handling exceptions for a 6888x ?

I am building Yet Another Function Plotter. Upon
excecution of the formula an alert should be displayed
whenever "operand overflow", "illegal argument" etc
occurs.

I used Pure C which supports 6888x but the 'signal()' function
does not handle 6888x exceptions.

I asked Eric Smith but MiNT currently does not support
6888x exceptions. It supports 6888x on context switch.

Is GNU as solution ?

I tried to write a handler in assembler, this failed up to
now because of insufficient TOS/assembler knowhow. And because
I cannot debug these things. During exception handling the
Trace-bit is OFF so the debugger does not stop.

Who knows a solution ? Assembly / C source / ideas welcome

Thanks,

Source record: 216828

In a latenight attempt to stave off sleeping, I decided to login to the cleveland freenet and check out the latest online magazine issues. Tonight I opted to read Atari Explorer Online.

The first 1/5th had the usual coverage of the latest usergroup meetings. The middle 2/5th's were a review of Atari magazines, both printed and online; Atari Explorer Online was given 4 stars- one reason being they don't waste excessive space covering non-Atari related information (ala ST Report). * The final 2/5th's were an extensive statistical analysis of some moronic * Star Trek survey that had a sample size [on average] of -49- people.

The reviewer bitched about how ST Report spends so much time covering other industry news. Personally, that's my favorite part of the magazine. There isn't any point to being insular about the Atari market. AND YOU COULDN'T BE EVEN IF YOU WANTED TO, IT'S NOT BIG ENOUGH.

THIS MESSAGE HAS NO POINT, EXCEPT TO BITCH ABOUT THAT FUCKING STAR TREK ARTICLE.

I am a die-hard Atari user.
AND
The only show I watch on TV is Star Trek.

But this was one of the most stupid/useless/annoying things I have seen in quite a while. If my choice is between this kind of material and information about the latest breakthroughs in LCD display technology or floptical seek rates: I'll take ST Report thank you very much.

Thank you for reading this message. It has made me feel better to vent my frustrations..

Hi,

Recently I bought a HP deskjet 500, to replace my defective star lc10-24,
but I run into one problem:

I do use FirstWordPlus heavily for documents containing images,
however, the printer driver I found, does not print the images at all.

Is there somewhere a driver for FWP and HPdj500 which can handle this?

Is it possible at all?

Thanks

John

:
: Mark

The last ST Format (October issue) stated 499 pounds sterling for the
"basic" Falcon in the UK, and (I think?) 899 pounds sterling for 4Mb
RAM and Hard drive (48Mb?) which seems pretty reasonable to me. I guess
Mega prices are going to drop like stone...

The latest version of Rufus I know is the V 1.11 rel-9. Rufus has been changed totally since V 1.10 so I don't remember how to put the echo off. Just search in the menus. I think echo off is default, so the last solution will be removing your configuration file (RUFUS.RUF).

I didn't find the latest version of Rufus on my first adventure through Internet at a.a. I just found the quite old (but funny) version 1.02 there.
Anywhere I heard about the version 1.20. Is this true?

I have just uploaded chop.arc to the New directory on
atari.archive.umich.edu. It lets you use the SEGA glasses with the RS-232
interface (like they do on the PC) with old software which supports the
StereoTek glasses. I did it because the StereoTek glasses are no longer
available. I also recommend taking a look at molecule.arc, it works really
well with chop.arc and the SEGA glasses.

YOu mean it doesn't fully support templates? I have been able to compile
simple template classes, I just can't get the << operator to overload
with a template class. By the way, my TT has 8 megs of memory so I don't
think running out of memeory is my problem...

There is a decent Epson 9-pin and 24-pin driver available as freeware. The package is called: Chuck's printer drivers. It is available on mac sites which mirror the info-mac archives (wuarchive.wustl.edu, for example). You can always search for it under 'chucks' using archie.

Mike, the best suggestion I could possibly give you is to call up the CodeHeads and ask _them_ if there are any fixes for your Warp 9 problems with your TT. Since you say you bought it at the Glendale show, I assume you live in California so give 'em a ring and ask.

Then let us know what you find out. :)

okay... TDD tech info

5 bit baudot code
26 chars (upper case only)
2 shift characters (alpha shift and num shift)
the same alpha codes are used for numeric digits after a shift character.
Must shift back to alpha later....

The carrier is momentary. It exists only while a character is being
transmitted. Then there is silence until the next character. The SAME
carrier is used by the other end... hence the need for silence between
transmitted characters.

The bit rate is about 45.45 baud (ca. 50 or 60 wpm)

the 5 data bits are bracketed by a start/stop bit pair.

jc

>
>> It seems to me that Atari would have a hard time marketing the Falcon with
>> similar configuration for ~$1300 as I've read in this newsgroup.
>
>Although it is twice as fast, has DSP, and ....

The real problem here, folks, is that Apple, _not_ Atari, has the marketing savy to get their new mass market Macs (Performa line) into retailers such as Sears, Silo, Lechmere, etc. While Mom & Pop are looking at the new washing machines, why not take a peek at these new fangled `pooters' too? Apple execs estimate there are still 7 million homes in the US that could afford a computer and don't yet have one. That's their target.

The Performa 200 is a repackaged Classic II and the Performa 400 is the LC II with a different nameplate. Only the Performa 600 and 600CD (at $2K & $2.5K) are new, based on a 32MHz 030 (crippled), the latter with built-in CD-ROM.

Question 1: Is the Falcon a superior machine for the money? A: Yes.
Question 2: Does it matter to the mass public? A: No.

Why? Because they won't know anything about it! John Q. Public still thinks Atari either a) "went out of business long ago" or b) "just makes video games."

Apple will literally sell _millions_ of these things while Atari is still struggling to find a few dealers willing to carry their hardware. Sheeesh.

What? Me bitter? Nyaaaah. :)

>I'd love to work on TeXdraw if I had the time (first thing: convert
>the sources to C).

And just to spice up the debate; there is at least one Modula2->C
translator. Use archie to search for p2c; it supports several
versions of Pascal, and considers Modula2 to be one such. I'm hoping
it's capable of being compiled on an ST without TOO much work.

Modula2 probably has a number of advantages to C; unfortunately for
the TeXDraw purposes, C compilers and C programmers are far more
common. I wouldn't mind seeing a colour version of it, even if it was
a little limited in screen size.

gcc 2.0 and above support templates. This seems to be a bug in gcc in
general, not just on the ST. The two bombs are probably a result of
cc1plus getting a fatal error. On my Sun, cc1plus aborts with a
segmentation fault when I compile the same code.

>for Gail Bacani (sp?) and was informed the number was disconnected.

Ken, I haven't called Gail for awhile but the last I knew, her number was still (408) 745-2022. Gail is primarily responsible for Developer Support, BTW. Tech support used to be at (408) 745-2008 but if that fails, why not just call the Atari switchboard at (408) 745-2000 and ask.

If Atari keeps their promise, Falcon owners will have access to a free 800 line to call for tech support. Of course, I don't actually recall hearing them say they were going to _man_ this line. :)

3482. Hardware problem? Help please!

Newsgroup: comp.sys.atari.st
Date: 1992-10-02 16:02:13 UTC
From: thiele@quando.quantum.de
Message-ID: <1992Oct2.160213.2131@quando.quantum.de>
Source record: 216702

Hello everybody,

I have a problem with my MEGA ST, and I hope that someone can help me
a bit!

I have a MEGA ST 1 with a 4MB extension and TOS 1.2. I am running MiNT0.95,
and when I leave MiNT, a bus error occurs! This happens after MiNT writes
'Leaving MiNT' (without an error message). MiNT itself has no problems,
and it runs well!
This is not a problem of MiNT, because this happens since some days and
not before!!!!
This is also no hard disc problem, because the problem occurs also when I
start MiNT from disc. Maybe it is a problem with the memory extension,
but I can fill the whole 4MB (e.g. with MGR) without having problems.
Maybe the MMU is getting mad?
By the way: I can boot GEM e.g. with bootgem, or with mint.cnf without
any problems.
Some more 'diagnostics': When playing 'Railroad Tycoon' or `Elvira',
a bus error occurs when I move the mouse into the last screen line!
This happens since some days, not before!
(original discs, no virus problems!) But the most programs does not have
problems (or I do not find them)
It seems to be a little but nasty error.

Is there anybody who can figure out what goes wrong? Maybe someone has
had the same problem (and solved it). Or has a 'feeling' what error it is.
I hope someone can help me.

Thanks in advance

Holger

| Although it is twice as fast, has DSP, and ....
| well, I'm just wondering: why am I answering this kind of post ?

Because you don't realise what an influence software support has on people perhaps? Don't flame me, I'v had an ST for 4.5 years, and I'm getting fed up with the way software companies are withdrawing support for the ST. My next machine (hopefully I'll get one next year) will probably be a PC (ugh!)

>Get /pub/atari/graphics/convert/Index ....

Hold on a sec. As far as I know, Gemview (even the latest) reads
everything (even jpg) but it only saves in img (either color or monchrome).
This person is asking for a converter program. A good program for doing
this kind of manipulation is the suite of PBM tools (I believe you can get
them on a.a.). It will take a little bit o' shuffling, but they work really
well, and give you lots of control over the output - in fact probably more
control than most people will ever use! :)

However, if all you want to do is look at a nice picture, then
Gemview will work just fine (if a bit slow on a non-TT machine).

BTW, does anyone know if Gemview will work on the Falcon? It looks
like whoever wrote Gemview adhered pretty well to all the VDI stuff, as it
works well with cache on, and even with Warp9 installed (even if there is
no speed improvement).

3488. STaladin 1.50 ...

Newsgroup: comp.sys.atari.st
Date: 1992-10-02 21:03:05 UTC
From: baffoni@aludra.usc.edu
Message-ID: <1aide9INN8i4@aludra.usc.edu>
Source record: 216701

Hi all,

I just downloaded the latest interim release of Aladin (1.50). Since I went through the d/ling and all that (and since the docs say its ok to distribute), I was wondering if there is any interest in having it put in A.A. or any of the other archives.

Its not like a real big deal, but since I'm lazy I won't if there is no interest.

BTW, email if you are interested - we probably don't need to waste more bandwidth than I already have. :)

-Mike

3489. Re: For Sale: ATARI STe, plus accessories

>I'll pay the shipping on the last three items listed; and I'll be glad
>to answer any questions I can about any of the above.

I may be interested in the Videokey and/or the glasses; I'd like to
discuss further, but I'm going to be away from the office for a week. If
by 10/12 you still haven't sold either of these items, please let me
know that they're still available.

Thanks,
Robert Coleman

Yup, various ACCessories like to have their own accessory slot. For
instance, you don't want to run the Control panel under Chameleon, or
(I forget the name) the background disk formatter. Only way to tell
is to experiment...

I'm not too sure about the difference between 6.0.4 and 6.0.5, except that a lot of software says you must have _at least_ 6.0.5, and some even says 6.0.7 (which I uderstands works with Spectre--except for sound--yet).

I also use Chuck's printer drivers, but they're not the best. Text looks chunky even in high-res, and it can't accept some curves (i.e., using Mac Draw, some shapes come out flat). I've got another driver (can't remember what it's called) but it's so incredibly slow it's useless.

>
>Has anyone had any experience upgrading their TOS beyond 1.4?

If you're already planning to go with Jim Allen's stuff, just wait 'till it gets released. He had some brochures on the Turbo-RAM board at the Glendale Atari Fair, said the board would be ready Real Soon Now. You will probably need TOS 2.06 to take advantage of it, and you will probably be able to plug TOS 2.06 right into the Turbo-RAM board, so don't worry about it for now, wait until the board becomes available.

California, land of dreams. For many, moving out to CA is their first step toward fulfilling their dreams. For most of them, it's also their last.

3494. MiNT ** Can an application communicate with TOSWIN? **

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 00:18:31 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <kDL2RB1w165w@ersys.edmonton.ab.ca>
Source record: 216724
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been thinking about writing a desktop replacement that takes advantage of MiNT. In order to do this, though, I would like to be able to tell TOSWIN to run a TOS/TTP program in the background (in a window).

Is there a way to do this? I know that I can start a process running in the background using the BG/LIMIT/NICE programs included in the MiNT utility package, but that method will not place the program being run in a Window like TOSWIN does.

The best possible situation would be if an application could tell TOSWIN to execute a program in a window, assign a priority to the program, and limit the ammount of memory it could use.

Is there a way to do anything remotely like this, short of writing my own program to handle the windows and control the output of each process?

Any help would be appreciated.

There's one burning problem I have, hoping to find a solution here:

Are there programs that can rename *.ACC as -eg- *.ACX at a pre-programmed
time and then change it back without anyone intervening from any input
device?
Or is there- that'd even be better - a way to deactivate *.ACCs at a
given time and then have them reactivated at a preset time.
If such solutions do exist, please mail me at
Markus Schlegel@BN.MAUS.DE
so I don't miss an information!

Thanks a lot in advance!

Source record: 216715

how exactly is color on the Falcon handled? i know max color mode
is 16 bits. is that 16 bits colors total?

i'd think not, considering 16 doesn't exactly divide evenly into RGB
(what to do with the extra bit?), but it might be 4 bits each + a
brightness range, similar to the Apple II GS.

i'm -hoping- it's actually a 16 bit pal, with 24 bits color total.
that would provide acceptable true color. plus that makes it easier
to do things like color cycling...

jason

Falcon + ethernet + MPEG + 1 gig removable optical drive + csh clone =
the machine i've been dreaming about for the last 5 years.

now if atari just -supports- the damn thing...

Speaking of the Best Card (it's actually by Wizztronics who also
make that cartmaster) I took a look at it at the Glendale Show.
Really neat design. The guy who made it said that he didn't like the
other upgrade cards out (like the TEC I assume).
His upgrade card fits the TOS 2.06 and the 68000 on one socket/card.
Very low profile. The installation is to basically to cut out your
68000 and put in the new card/socket. The TOS 2.06 sits on the
underside of the card fully socketed to upgrade in the future. And
the 68000 sits fully socketed on top with hardly a noticeable increase
in height. He said that it's actually easier to install his card in a
previously unsocketed 68000 machine than it is to install all the
jumps and stuff in the TEC. Of course if you have your 68000
socketed, it's as simple as plugging in the tiny new card with the
68000 already on it. It's a clean design because there are no
jumpers. Installing the switch between the old and new TOS involves a
couple of jumpers and bending up a few pins.
I was a bit wary (and still am) of cutting out my 68000 and sticking
in his socketed one, but he made it sound pretty easy (I've done some
soldering...). I don't think that card comes with any software but I
could be wrong. Gives the TEC a good run for it's money tho...
I'm still deciding. An accelerator sounds good too. Where did all
my money go? :)

>brightness range, similar to the Apple II GS.

The full color mode (not the overlay mode), is straight 16 bits, the
extra bit is given to green I think (could be blue) because of the
lack of strength of green output by a monitor. Then that would be 5
bits red, 6 bits green, and 5 bits blue. The overlay mode is 15bit
color with a 1 bit overlay (titleing and genlock effects) whick gives
5 bits per color. There is no palette in these modes.
Correct me if I'm wrong...

>FAQ? Or could it be added to the FAQ directly?

The basic hardware differences from the ST, Mega ST, STE, Mega STE,
TT, and Falcon should definately be in the c.s.a.st FAQ in the
hardware section. I'd write it except that I really don't have all
the info (I would be close, but no cigar). Does somebody have the
info or an article saved somewhere that we can add to the FAQ.
The Falcon specs are already in there. I have some old TT and ATW
(or Abaq) specs laying around to that could possibly go in the FAQ.

On a similar note, the TOS differences should be somewhere as well.
If not in the FAQ then on Atari.Archive with a pointer to there in the
FAQ. These are some basic files that this group should have produced
a long time ago. But in the 5 years or so of reading this group, I
don't remember seeing this.
I can contribute some info, but I don't have it all.

I must agree somewhat here. As much as I *love* ST and TNG and the
article, I realized that there are plenty of people wondering why they
can't put more Atari coverage in there instead of space filler.
Between ST-Report and AEO and, say, Genie-Lamp (not a bad mag when I
see it), I could cut and paste together a darn good weekly magazine.
As much as ST-Report has been (and still is somewhat) gossip, AEO
seems to be half fluff. No Real substance half the time. Less original
material. Reprints, etc.
Yet, on the occasion that I read ST-Report, between some of the junk
and ads I find some *very* useful and interesting material. And I
wonder, if AEO is supposed to be better, and ST-Report is supposed to
be sooo bad, why can't AEO have this useful Atari info. I guess we
have no happy medium.

Read all the electronic mags if you can get your hands on them.

3507. Rendering CAD3D/Cyber scenes?

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 12:56:07 UTC
From: s19184@seb.se
Message-ID: <1992Oct3.135607.1@seb.se>
Source record: 216725

Is there a program to do good renderings of CAD3D (Cyber Studio) scenes?

If have RenderRez 1.0 but it gets confused as soon as there are a few objects in the scene.

Lexicor's Prism Render looked good in the adverts and ths STart preview but when I rang Rio Computing last December, they said that Prism Render was not available (despite the ad's) and they had no release date.

Is Prism Render now available? Experiences? Who do I contact?

Any other suggestions?

3508. Autoconfiguration of *.ACC

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 13:30:00 UTC
From: Markus_Schlegel@bn.maus.de
Message-ID: <A5602@BN.maus.de>
Source record: 216790

Is there any possibility on the Atari ST under TOS 1.02 to

- get *.ACCs to work at a preset time and vice versa deactivate
them at a given time?

- Autostart and then autoEXIT a *.PRG at a preset time?

My problem is the following: I'm trying to set up a fax-polling-facility
with a 1040ST, using a BBS-System for polling faxes, which are put into
a directory by a fax-receiving *.ACC.
The problem is that both, fax.ACC and PRG demand full control of the
RS232 serial intervface as long as they're being active, so that once
the *.ACC is started, there's no way back to normal data-transmissions,
only fax would work. EXCEPT for the possibility of deactivating the
.ACC somehow, going in to the BBS and then re-activate the fax-.ACC-
module.

Thanx-a-lot for your responses in PERSONAL MESSAGE (since I don't and
cannot read this newsgroup) to

Very good John, but there's a bit more to put into the
equation:

It doesn't matter which machine is better, what matters is
which machine has better software (and I don't just mean one
or maybe two programs), more software, better peripheral
support, more peripheral support, better 3rd party support,
more 3rd party support. Furthermore, think about developers
and BIG software companies...are they going to develop for the
better machine, or the machine that more people own and from
which they'll earn more money. Considering the installed user
base AND new potential user base, the answer for software and
peripheral developers is clear.

No flames please, this is not an attack...just a follow up to
what I thought was a fair appraisal of the situation.

I did. It's listed in the ls-lR file as being 27th Sep, but isn't in the
/atari/Archivers directory as stated. Anyone know why? Has it been
withdrawn?

The permissions on /atari/New are wierd, and prevent my seeing what's
there.

Atari 1040ST, Atari 1224 Color Monitor for Sale

Software included:
Licence to Kill, Beverly Hills Cop, Swiftar, World Games, Leather Goddess of Phobos, Pinball Magic, StarGlider, Indy (the Action Game), Boulddash Construction Kit, MindWheel, Scruples, Hacker, ST-Talk, Time Bandit, ProCopy 1.6, Music Studio, ST X-Former (& cable), Dungeon Master, PC-Ditto, BattleZone. Missile Commander, Laser C, Language Disk, 1st Word

Other:
Clock Module (battery is dead and needs changed), Joysticks, Midi Cable.

Make an offer - I'm not sure what all of this is worth. I need to get rid of the system to pay for some college expenses.

Also available:
Atari 1200XL, 1050 Disk Drive, decent software
Atari 2600 with about 20-30 games

Respond to cdowns@eve.wright.edu if interested.

3514. Falcon in Holland

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 17:12:38 UTC
From: leonp@cs.kun.nl
Message-ID: <BvK2H3.9xr@sci.kun.nl>
Source record: 216731

Today I went to a local computer shop to ask if and when they would
sell the Falcon. I had a nice chat with the guy and he told me the
following things:

- This shop (Byte) will certainly sell Falcons.
- The Falcon will be introduced in Holland in Februari 1993
- The first two month of production are already sold out, though
eaxct price isn't know yet
- Price will be between 1400 and 2000 Dutch guilders, including HD
- No Falcons without HD's will be sold in Holland
- Introduction to the general public is feb 1993 because atari
wants to be able to sell a computer with a large software base
which is under development now.
- MultiTos or other Tos is uncertain (verybody hopes for MultiTos)
but it's not unlikely that it will be sold only with MultiTos
- Case is uncertain. Certainly no 1040 case !!!!!
- They think that falcons will make lifer for cheap Macs tough !! :-)))

Atari just may have a winning machine and I just might buy one....

One word of warning: the (Degas) PI1 to PPM converter in the latest
PBM+ distribution is hosed. It reads a longword for the resolution and
16 longwords for the palette entries. This isn't right; you need to
change the read_biglong functions calls to read_bigshorts.

3517. Timeworks DTP with Star printer question

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 18:23:06 UTC
From: jtrimble@sdf.lonestar.org
Message-ID: <BvK5qI.2I4@sdf.lonestar.org>
Source record: 216754

I'd like to use my recently acquired Star NB24-10 24-pin printer with my Timeworks Desktop Publisher. Can anyone lead me to a printer driver? I have not tried every single setup in the set that came with my Timeworks DTP program, which, if I read the information correctly is version 1.1. Perhaps one of those will work. As users of this program know, it involves a serious setup effort for each version.

To date, I have simply used the DTP program with my old Epson 9-pin. I expect (hope) the Star will yield better results.

The following might have some bearing on the appropriate printer driver.

I have set the Star's DIP switches to emulate an IBM Proprinter, G mode. I find that this allows me to easily print foreign characters that do not seem readily available with the Epson driver when I am using Wordwriter along with a desk accessory that inserts foreign characters. It would be nice not to have to reset the dipswitches, but of course, I could manage. Factory settings emulate the Epson LQ-1000, according to the Star manual.

Thanks for suggestions emailed to jtrimble@sdf.lonestar.org

I have a STOCK //Turbo BBS 2.1.9 system with some problems.
I'm looing for SysOps who have used the Sigs compiler in Tsysgen2
and had it work well (I can't seem to make Handles only bases).

I'm also having problems interfacing lharc201(x) into the system,
the examples say to use lha201.ttp, but so far... nothing ends up in the
tmp directory.... it goes to the BBS directory instead!

Odd.....

If you're a sysop, and can reach me email, please do.
John Cummins (running Registered //Turbo 2.1.9)

Macintosh LC IIs still overprced for the speed they offer.
Also System7 soaks up 1.5-2megs (depends on fonts, etc) of memory.

I believe the term set-up is fine since the vt100terminals work without
any problems. I'm going to try uniterm out, since it quite annoying
having to refresh the screen all the time.

3522. Toaster for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 19:29:52 UTC
From: jamesb@warren1a.its.rpi.edu
Message-ID: <5apz69#@rpi.edu>
Source record: 216748

What if New-Tek developed a Toaster for the Falcon? With the economical advantage of the Falcon, could there possibly be a video studio that costs less than $3500? What would happen to the Amiga if there was a Falcon Toaster that was cheaper and faster than an Amiga Toaster?

My roomate, an Atari user feels that the time is long overdue for New-Tek to cross over to other platforms. I calmly told him that the Toaster is dependant on the Amiga's unique architecture, but he wouldn't shut up. Can anybody settle this for us?

He insists that the Falcon architcture is much too revolutionary for New-Tek to ignore, and is graphically superior than the Amiga. He thinks that he can convert me in to an Atari user. Although the Falcon is a pretty good computer....

Peace,
Basonge

Once again, a comparison of apples and oranges. What one has to remember with the LC is that high resolution color is NOT standard. It can be added at the price of adding VRAM and a board. The high resolution color for the LC is what seems to be standard on the Falcon. Also the LC does not have a built in DSP. I think the Falcon will find its niche in the music and video market which is a market a stock LC is not equipped to compete in.

3525. Backing up the HD -- AGAIN

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 19:58:21 UTC
From: hack@stsci.edu
Message-ID: <1992Oct3.195821.19272@stsci.edu>
Source record: 216728
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

In my previous posting, I had requested some advice on the best utility to use in backing up my HD. My problems arise from not being able to find a program that will compress the files while backing them up or being able to restore the files once backed up.

In response, I was directed to use TURTLE. Unfortunately, this is the exact program I was referring to in my original post. After reading the docs to the version I know about (Version 3.20), it will NOT compress contrary to the advice, there is no method given for restoring said backed up files onto the HD again, and worst of all, I can not run it to back up onto DS 720k floppies because of shortage of memory for the RAMDISK.

If there is a newer version that overcomes these problems, please tell me/us about it. If there are simply undocumented options I do not know about, please tell me. Otherwise, any other suggestions will be greatly appreciated, even if it means purchasing the program.

Please accept my apologies in advance if I have offended anyone with my remarks about TURTLE. There just has to be something available that will do what I need, and it just wasn't it.

3526. Carbon Copy for Mac on Spectre?

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 20:01:29 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Oct3.160129.25969@newstand.syr.edu>
Source record: 216740

Just out of curiousity, is anybody out there using Spectre to
run a remote Mac with Carbon Copy for the Mac? If Spectre
could handle System 7, we might be able to use Remote Access...
but without System 7 support, I thought maybe Carbon Copy
would work. Anyway, if anybody has seen this work, I'd be
interested in hearing how well or poorly it works...Also,
what speed modems were used.
Thanks,
Gerry
ggreenbe@rodan.acs.syr.edu

3527. Falcon 040 / Windowing UNIX

Newsgroup: comp.sys.atari.st
Date: 1992-10-03 20:01:44 UTC
From: humphrie@wam.umd.edu
Message-ID: <1992Oct3.200144.25301@wam.umd.edu>
Source record: 216747

markjl mentioned something a while back about the 040 getting "full blown windowed UNIX". Does anyone else have any info/rumor reports about UNIX?

The last thing I heard about windowing UNIX was depressing. In one of those online confs. with one atari gurus it was stated that atari would NOT be working on getting X or anything like it working on the FALCON.

I'm addicted to X windows and I can't see buying such a snappy machine if it won't support the OS/GUI I like.

any info is appreciated, EMAIL me!

```
WANTED: ST/FALCON SYSOP
-=-=-=-=-=-=-=-=-=-=-

The Cleveland Free-Net Atari SIG is looking for a new
16/32-Bit Computers Support Area SysOp.

If you enjoy using your Atari ST computer and will most
likely get a Falcon030, please consider being CFN Atari SIG's new
16/32-Bit SysOp.

These are the qualifications:
----------------------------

* Enjoy using Atari Computers

* Strong background using ST computers

* Plan on having a strong background using the Falcon030

* Dependable/Reliable

* Long-Term stay with the SIG in mind (6+ months)
(if using Internet, should have access to telnet for the
distant future)

* Not easily depressed with Atari's present marketplace

* Perserveres

* Has time needed to give the Support Area the attention it needs
(near 10 hours a week)

* Able to work with people

* Not afraid to learn new things

* Favores Atari Online Conferences on Free-Net

* Able to answer questions (system, software, etc.)

* BART and Atari Archive knowledge

* Accounts on one or more of the following services:

GEnie, CompuServe, Delphi

Pluses:

* MIDI Knowledge

* Programming/Developing Knowledge
```

The Cleveland Free-Net Atari SIG is attempting to make itself
THE place for ST and Falcon users. If you are interested in helping
accomplish this goal, please respond with e-mail.

The benefits are:

* SysOp account (aa###) ID

- unlimited time
- access to SIG account
- If local, special SysOp telephone line (to avoid constant
(busy signals)

* Greater knowledge and understanding of the ST and Falcon030

* The satisfaction of helping others

* New friends

* Management experience

The following is what you will be managing:

<<< 16/32-BIT COMPUTERS SUPPORT AREA >>>
ST/e,Mega ST/e,TT

>
>Any other suggestions?

I would not recommend dealing with RIO when you want to buy Lexicor Software.
To put it lightly, RIO has done some bad things that Lexicor didn't like.
I don't think RIO can sell Lexicor Software any more.

Contact Lexicor directly or a good dealer. Lexicor's number is 415-453-0271
and their fax number is 415-453-0533. They're in Northern California.

3539. MIDI Merge

Newsgroup: comp.sys.atari.st
Date: 1992-10-04 03:48:33 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <3OCT92.23483355@cc4.crl.aecl.ca>
Source record: 216760

Both my piano teacher and I have STs, Roland digital pianos, and Roland sound boxes (I have an MT-32 and she has a Sound Canvas).

We both want to avoid spending over $100 for a MIDI merge box that would allow either the ST or the piano to be the system controller without having to move cables around.

What is needed to build a MIDI merge box? Thanks in advance.

BTW, I have a small Atari dealership and last week Atari USA told me it did not have a new dealer price list yet. However, in AEO's last issue, one company described Atari's new lower prcing! Why is it one dealer can get a price list and another is told they're unavailable?

In article <kDL2RB1w165w@ersys.edmonton.ab.ca>, mforget@ersys.edmonton.ab.ca (Michel Forget) writes:
> I have been thinking about writing a desktop replacement that takes advantage
> of MiNT. In order to do this, though, I would like to be able to tell TOSWIN
> to run a TOS/TTP program in the background (in a window).

No problem -- TOSWIN opens up a pipe (u:\pipe\tosrun) and listens there for requests. To run a program in a TOSRUN window, you just have to write the initial directory for the program, program name, and arguments, all separated by spaces and terminated by a 0. (Make sure that all of this is written with one Fwrite call, since otherwise if two programs are accessing the pipe at the same time their writes could be interleaved.)

Here's a sample implementation:

```
---------------------- cut here -----------------------
/*
* runtos: a small program that will launch a TOS or TTP program
* in a TOSWIN window.
* To compile:
* gcc -O -mshort -o runtos.prg runtos.c -lgem16
* To run:
* runtos someprog.tos arg1 arg2 arg3
* OR
* Using the desktop, do an "Install Application" on runtos.prg.
* For "document type", use .TOS. Now, double clicking on a TOS
* program will automatically start it up in a TOSWIN window.
* (unfortunately, it will also cause all TOSWIN windows to be
* hidden -- you'll have to select "TOS programs" from the DESK
* menu to get them back again).
* BUGS
* See above. Also, it would be nice to have a "runttp.prg"
* that would prompt for .TTP arguments. This is left as an
* exercise for the interested reader. Reporting errors is
* also left as an exercise.
*
* "runtos" was written by Eric R. Smith and is hereby placed in
* the public domain.
*/

#include <minimal.h>

long _stksize = 2*1024;

int
main(int argc, char **argv)
```

```
{
/* BUG: shouldn't have a fixed size buffer */
static char buf[1024];
char *where = buf;
int i, fd;
long r;

if (!argv[1]) return 2;

/* first, put the path */
*where++ = Dgetdrv() + 'A';
*where++ = ':';
Dgetpath(where, 0);
if (!*where) *where = '\\';
strcat(where, " ");

/* next, put the program */
strcat(where, argv[1]);

/* finally, put the arguments */
for (i = 2; argv[i]; i++) {
strcat(where, " ");
strcat(where, argv[i]);
}

fd = Fopen("U:\\PIPE\\TOSRUN", 2);
if (fd < 0) return 1;

r = strlen(buf) + 1;

if (Fwrite(fd, r, buf) != r)
return 1;

return 0;
}
```

3542. MiNT library patchlevel 24 now available

Newsgroup: comp.sys.atari.st
Date: 1992-10-04 05:30:49 UTC
From: ersmith@uwovax.uwo.ca
Message-ID: <1992Oct4.013049.1@uwovax.uwo.ca>
Source record: 216757
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just uploaded a new version of the MiNT library to
atari.archive.umich.edu. It's patchlevel 24 (patchlevels
21 to 23 were "internal" releases :-)) and may be found
in Mint/mntlib24.zoo (library source code) and Mint/mntinc24.zoo
(header files). Compiled versions of the library will be uploaded
shortly.

This library is for use with several C compilers, as a replacement
for or supplement to their normal run time libraries. It will
produce executables that will run under either TOS or MiNT,
although multitasking features such as pipe() and fork() require
MiNT to be present to work properly. Compilers supported are:
GNU C, Pure/Turbo C, Sozobon C, and Lattice C.

Many thanks to Howard Chu (who contributed the GNU C -mbaserel
support for this version), Michael Hohmuth and Ulf Moeller (for
the Pure C support), and Jwahar Bammi (for numerous bug fixes
and enhancements).

Subject: Slightly updated version of UniTerm available
From: poole@chsun.chuug.ch (Simon Poole)
Date: 27 Feb 92 17:02:37 GMT

A slightly updated version of UniTerm is available from

chsun.chuug.ch

Directory

/archive/software/atari/UniTerm

there's a tar'ed and compressed version of the distribution and a
unpacked version. (Please read the README in the directory -first-.)

>in the sheet, once in the main text and once in the technical specs. The actual
>wording in the main text is "The top resolution in true colour is 768x480". Does
>this imply that higher resolutions might be available in other modes

I believe what you are hearing about is the true color mode with overscan
enabled. According to the document posted by John Townsend (a very complete
listing of Falcon graphics modes and overscan/monitor capabilities), the
Falcon can do "true-color" on a TV or SC1224/SC1435 monitor in a 640x400
resolution. This would be equivalent to ST hi-res monochrome, just with
65534 more colors. :-) Notice that with video titling enabled (this takes
an extra bit), true color is only 32768 colors, not 65536.

Ok, so now you throw in the overscan, which, also according to Atari,
multiplies _both_ the x and y resolutions by a factor of 1.2, you will get
a resolution of 768x480 with 65536 colors. Notice however that this can
only be accomplished on a TV or SC1224/SC1435 (with interlace, although
supposedly the interlace is not very irritating) -- on a VGA monitor you
get rid of the interlace but due to limitations in VGA monitors you
can't get true-color in better than 320x480 and you can't do real overscan
(check the Townsend document for a description of overscan and how it
works on VGA monitors). Ironic that the older monitor can do something
the new VGA ones can't, isn't it? :-) I guess this is a good reason
to keep your SC1224, so you can do real hi-res true-color.

Ok, that should answer your question, have fun!

From: f92joah@fy.chalmers.se
Message-ID: <1992Oct4.101811.4852@fy.chalmers.se>
Source record: 216767

I just would like to inform about the FALCON in Sweden.

The market for Atari in Sweden is very hard at the moment. The Computer magazines have announced that Atari Corp Scandinavia is going to close down. Something really needs to happen, or Atari will soon be history in Sweden.

Therefore it is great good news that the Falcon will be available here in Sweden in the end of OCTOBER 1992. A friend of mine has already ordered one, so he will be one of the first Falcon owners in Sweden.

The price is 6000 SEK (about $1000) without harddisk and 8000 SEK (about $1300) with 40 MB harddisk. The Falcon will be equipped with 4 MB as standard.

I will return with a report when my friend has his Falcon.

STOP !

The problem is not in the monitors (well also, but..):

You can't get 768x480x32K on VGA monitors, cause it requires a too large bandwidth. On TV, you can do interlace which halves the necessary bandwidth. But you if you try to interlace on a VGA monitor, the vertical sync frequency goes too low for most monitors (that's also why the 320x240 is doube-scan).

In fact interlace permits to display at only 30 frames/s: that's much slower than typical 60-70 on VGA monitors. This low rate is the key to the low necessary bandwidth:

768 x 480 x 2bytes x 30Hz=768 x 480 x 1byte x 60Hz !!

> Ok, that should answer your question, have fun!

> Ben Gilbert
> bgilbert@cs.washington.edu

So either you get full color and headache or none of them !

>
>thanks for any help
>
>david

Hi!

You can access the SCSI-IDs 0-7 with an ICD AdSCSI. If you have an adapter
with a sepearte clock on it this will have the SCSI-ID 6. So 7 are left.
If you want to use a second SCSI-Drive you just have to plug it in...
(eh... due to the short cable inside my case, i had to install a newer (longer)
one).
...and don't forget to change the SCSI-ID of the second drive to another than
zero (this could be done by jumpers on the HD).

Bye,
Wolfgang.

In case, there is also a 'split' program (I believe it is split.app)
at a.a (maybe in misc, but I can't remember) which splits a file
in smaller ones (you just specify the max size).
With lzh, it's just fine to do 'manual' backups (if you have enough
HD space to store the temp big archive)

Hm. Diamondback has compression, and doesn't require a RAMdisk, but I reccomend against that. With Turtle, you can restore from your backup simply by copying the files up from floppy. With Diamondback, you have to hope that nothing was damaged in any way. If it was, you're probably hosed.

The memory is a problem if you have a 512K machine, but WHY? RAM is cheap, and a LOT of software won't run in that limited space.

I was, at one point, frustrated with Turtle's lack of compression. After using Diamondback, and watching it try to compress .LZH files (and making them 10% larger each time), I gave THAT up quick. Turtle has problems, but it's better than the others... (now if I only had a floptical drive...)

If you format your disks on the ST with TOS 1.04 or newer you don't need any
program because disks formatted with these TOS versions can be used directly
on IBMs. I'm doing this for several years now.

>I think there must be a program to do this, but which?
>And where can I find it (pd/shareware/freeware).

You've asked for PD/shareware/freeware stuff, but I thought I'd let you
(and everyone else) know about a good commercial program which does a
great deal of conversions, as well as stretching, changing aspect ratios,
and so forth:

STyle 1.0 by Zocra Technologies, Ottawa, Ontario, CANADA
Loads and Saves any of the following formats (and can load
in one format and save in another, with numerous image
manipulations prior to saving):

AIM (.IM), BMP (Windows & OS/2), CP8, Degas (all filetypes),
EPSF, FastLoad (.FL), GIF, IMG, NEO, MacPaint, MacStartUpScreen,
PCX, TIFF (packbits only), Tiny (.TN).

Cost is around $35.00 Canadian funds. Zocra can be contacted at

#4, 319 MacKay Street
Ottawa, Ontario, CANADA
K1M 2B7

Phone: (613) 741-5817

I've tried this program, and it works like a hot damn (although using
certain manipulation-and-save combinations can be *quite* slow).

Hello,
I finally got a hold of Unix Windows the other day and like it a lot.
There is one problem though: I can't seem to be able to get XON/XOFF (^Q/^S)
handshaking to work. I have it set on both ends of the line (stty -a says so,
unless it's broken...), but I can't stop active output. I can stop/start
output when nothing is currently being output (e.g. at the csh prompt).

Needless to say, this problem is annoying when doing ls -lR and you can't stop
the output to read anything. :-(

Any help would be appreciated. Please reply to agostino@cs.concordia.ca.

Thanx,
Agostino Deligia

...which is not a very large market. Besides, the Mac is becoming more
and more popular among electronic musicians. If the Falcon captured
EVERY midi buyer I suspect that Atari would still just barely be able
to continue given current margins. They are going to have to convince
NEW computer buyers to enter into the Atari world and I just don't
see that happening because of (1) Atari's past blunders and reputation
and (2) agressive pricing by pc clone manufacturers and Apple.

Regards,

Chris

Just because atari doesn't do it doesn't mean it won't be done. There's no reason that a third party couldn't do an X port to the ST/TT/Falcon.

Indeed, I'm quite sure that X could be made to run under MiNT. I don't have time (or disk space!) to do the port, but I'd be happy to provide technical assistance to anyone or any group that does want to try it.

Well, I wouldn't say that. Remember, even if you are connected at the
lower baud rates, it still costs to download - but in most cases it is free to
d/l from the internet. Besides, as some have mailed me, they didn't know a
new version was available.

Oh, due to the requests, I have put alad15a.tos (zip self-extractor)
in Atari.Archive atari/New. I also uploaded aladoc14.arc (I changed it from
GEnie's name of "LD_DCV14.arc" because it seemed so counter-intuitive) because
I couldn't find a manual for 1.50 on GEnie. Actually, looking at the changes,
most are bug related, so the 1.4 manual should work fine. BTW, this 1.5
archive is the fu"ll o"ne for those who haven't used GEnie before - so it
includes a genie.lst, so if you want to keep your old topic lists, you better
extract it in a different directory.

Yes, I noticed this too, but this was after having one heck of a time
trying to unarchive the one I had been able to d/l about a week ago - it
wouldn't extract itself - I think perhaps the old version of stzip2.0 either
was or became corrupt, so they removed it.

>The permissions on /atari/New are wierd, and prevent my seeing what's
>there.

That is done on purpose so that the archive master (Weiner, right?)
has a chance to give them a look-over so that people don't spend hours on
corrupted files. When he has "checked them out" they go into more logical
areas - and since he is doing it, you can be sure they are put into an area
that makes sense. :)

I have removed my 68000 and several other chips on the ST motherboard,
and it's tricky, as traces break reaally easily. I was lucky I had access
to a mega st circuit digram, as one of the traces leading to the blitter
broke, and it took me several hours to track down with a continuity testor.
This was after using both a desolderer and desoldering tape. Any other
pc board work I plan to take to a shop.

>better machine, or the machine that more people own and from
>which they'll earn more money.

This is the catch-22 of the whole thing, isn't it? No one wants
a computer that doesn't have a lot of software available for it, and
no one want's to take a chance writing for a machine that has such
a small userbase. I wonder if Atari's money would be better spent
commissioning software to be written for them than on advertising?
Of course, every time thay've tried this, they seem to have have
made a botch of it. Remember Microsoft Write for the Atari? While
there are plenty of applications available from Europe, the extra
expense of re doing them in English must be passed on to a very small
user base, plus the usual import costs, so it adds to the price
considerably.
As an example, I found it much cheaper to mail order Pure C from
Germany than to buy it here. Considering the size of the market, I
realise Gribnif probably pays the same price as I did, so it's
understandable, but still not a very good situation.

Well, I've started using CoNnect 1.60, and I like it a lot, the
only problem is the fact that on a color system, to get a window that is
80X24, I have to use the dinky 6X6 font, which is hard to read. Does
anyone know of the easiest way to get a 7X7 font? This would make it
more readable, almost usable!

>a program that will compress the files while backing them up or being able
>to restore the files once backed up.

I've written an archiver program amongst the likes of ZOO and LZH which supports multi-volume archives like ARJ. You use a switch to specify how large you want each archive to be ('-c720') and it will compress all the files specified into a number of archives of 720K each. It works well, however: (1) Compression is a little slower than Zoo or Lzh; (2) it only stores files, so any empty directories won't be saved; and (3) it's a preliminary version, so you can't do an 'incremental' backup like most decent HD backup programs. Decompression is almost as fast as file copying, though. In any case, leave me E-mail and I will send you a uuencoded executable.

Source record: 216786

In <1992Sep30.154301.24346@netcom.com> despair@netcom.com (Scott Hanson) writes:

On getting the MIDI THRU signal from the Atari MIDI OUT port.

=>In your tiny "user's guide" there is a pinout for the Midi out/thru port.
=>The standard three pins (1, 3, 5) are signal & shield and (2,4) are thru.
=>Use pin 3 for the shield, there is no harm since the devices are allegedly
=>isolated. By the way, unshielded works fine for me over short distances.

...practically the only useful bits of information in that entire cheesy
little book. :-(

I started typing this from memory, and I had these pins all confused in
my head, partly because they're not numbered sequentially. I think
this is so that a 3-pin 180-degree DIN has pins 1,2,3 matching those of
the 5-pin. I'm now looking at the pin-out in the book.

Anyhow, the DIN jacks that I buy have the same numbering as the Atari
pin-out, which is: (looking at the back of the ST):

THRU loop return 3 1 THRU Tx data
OUT loop return 5 4 OUT Tx data
shield ground 2

Normal MIDI ports only use pins 2, 4, 5. Atari has folded in
a MIDI thru by using pins 1 and 3. It's possible to get a
hardware thru by simply connecting 1/3 to 4/5 of another jack,
and connecting the shield ground (?).

As I now look at the book, the Atari's MIDI in doesn't have the shield
connected at pin 2. This is probably normal; my scheme has the
shield of the cable from the Atari OUT connected to those of the 2
cables it's feeding. If anyone can tell me the Right Thing to do
with the shield, I'd appreciate it.

What we end up with looks something like this:

```
3 1 3 1
+----------------+ |
| +--------------------+
| | +-------------- +
5 4 5 4 5 4
+----------------+
2------------------2----------------2
```

MIDI thru Atari MIDI out MIDI out

I have incorporated the ST MIDI through into a switch that I
built---very crudely, no opto-isolation but it works. I just
make sure not to move switches when any data is coming through!

3572. Problem: Maps & Legends bombs with TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1992-10-04 22:09:04 UTC
From: s19184@seb.se
Message-ID: <1992Oct4.230904.1@seb.se>
Source record: 216788

I have version 3.04 of Antic's "Maps & Legends" and have discovered that it bombs with TOS 1.4 on most attempts to draw a map. It occasionally does not bomb, but in most such cases after a long delay produces an incomplete map. It only appears to produce certain maps of Europe correctly. I would guess that it is feeding incorrect parameters to VDI.

Is there a later version of Maps & Legends which works with TOS 1.4? Are Antic still around and supporting the ST in general and Maps & Legends in particular? I lost contact with them when STart folded. Does anyone have any suggestions as to where I should begin looking to find and correct the problem?

>---|||---|---

Yes, but the point is that the LC II will have the entire Macintosh software
base at its disposal, and plug & play compatibility with monitors, printers,
scanners, external hard drives, etc. For that price, plus the stability of
System 7.1 (soon to be released), and the dirt cheap prices of SIMMs (not to
mention virtual memory), I think that the LCII has a lot going for it, as does
its parent company with its reputation for quality and customer support.
Certainly more than the Atari Falcon, whose status is currently semi-vaporware
and whose parent company's reputation borders on comic.

>uucp: ...!{decvax,hplabs,ncar,purdue,rutgers}!gatech!prism!gt1448b
>Internet: gt1448b@prism.gatech.edu

That is correct, but hardly relevent. The LC has been discontinued by
Apple and replaced by the LC II, which does have built in support resolution
of 640x480x256colors on a 13" RGB monitor with the 512K VRAM module (about
$60). Sound is the standard 8 bit stereo, sans DSP, of course. The point
is that you can get a 68030 MAC with 8 bit color, add an FPU, and with 4
megs of memory and an 80 meg harddrive for about $1400 NEW! Calculated
into that price should be the consideration of the Mac software base,
reliability of system software, ease of peripheral expansion and configuration,
and overall product reliabilty and support. I was a former Amiga 500 owner
who saw problems in CBM's customer strategy which I believe has driven me
and countless other users out of that "niche". When Apple comes out with
its PowerPC and lowers its price further, I see Atari hanging on for dear
life with a product which has a game/productivity identity crisis that
Amiga 500's have suffered from since their inception.

Lemme amend my previous posting. I mentioned that you wouldn't have to worry about TOS upgrade with the TurboRAM board; that's not true. The TurboRAM board requires TOS 2.06, and doesn't come with a TOS upgrade option itself.

I'm posting the info I have now to head off any further emailed questions...

TurboRAM board fits Mega STs and all STe's, comes with 0, 2, or 8 MB RAM, so you can upgrade to a full 12 MB. Cost is $199 with no RAM, $359 with 8 MB. The board uses page-mode DRAMs and is supposed to have a "back door" to allow accelerators to get faster access. The flyer I have doesn't specify the actual speed of the DRAMs being used.

Ok, so you need TOS 2.06 to use the TurboRAM board, and it only fits in Megas or STEs. If you've got the right machine, you have at least 4 different ways to get TOS 2.06 into your system. If you have an STe, you just need to buy the chips for $60 and drop 'em in. Or, you can buy the TEC that Codehead sells, or you can buy the BEST board (sorry, the name still escapes me and I don't have the phone number for Best handy). Or, you can buy a Turbo20 board from Fast Technology - this says "allows easy use of TOS 2.06" which implies to me that you have to buy the chips somewhere else. Or you can buy a Tiny Turbo 030, which comes with TOS 2.06 onboard. For review - a Turbo20 is a 16MHz 68000 running at 20 or 25MHz clock speed. The 25MHz board is $349, I don't have a price for the 20 MHz board. These boards are supposed to work in all STs, the STe version costs $49 more. The Tiny Turbo 030 is a 40 or 50MHz 68030 with optional 60 MHz 68882. This goes for $599 at 40 MHz, or $699 for 50 MHz, and another $299 for the 68882.

I was on the verge of buying a pair of Turbo20's at the Glendale Fair, but decided that since I already have 16MHz 68000s in both my STs, any further upgrade I did would have to be to 68030 at least. The Tiny Turbo 030 is rather attractively priced, considering, but I feel it's a little hampered since it must use ST RAM, and you can't add any 32 bit RAM to it. They weren't advertising their full 68030 board at the Glendale Fair, only the 3 products I've mentioned here.

If you want more info, call Fast Technologies at 508-475-3810 in the US.
You can also order in Canada thru ISD Marketing at 416-479-1880.

PS - I am not affiliated with Fast Technology in any way, I'm just passing on info from an ad I picked up at the Glendale Fair. Also, the TurboRAM board wasn't ready for sale yet at Fair time, I don't know if it really exists yet now, either.

If you want info on the TEC board, contact Codehead Technologies at 213-386-5735. I'm not affiliated with them, either.

> 2. What was the ftp site specifed by S. Poole?

Roger Sheppard already answered 2. above... The answer to question 1
is "no." Simon didn't want the new version distributed thru any other
archives, dunno why not, but this is stated in the README file on the
given ftp site.

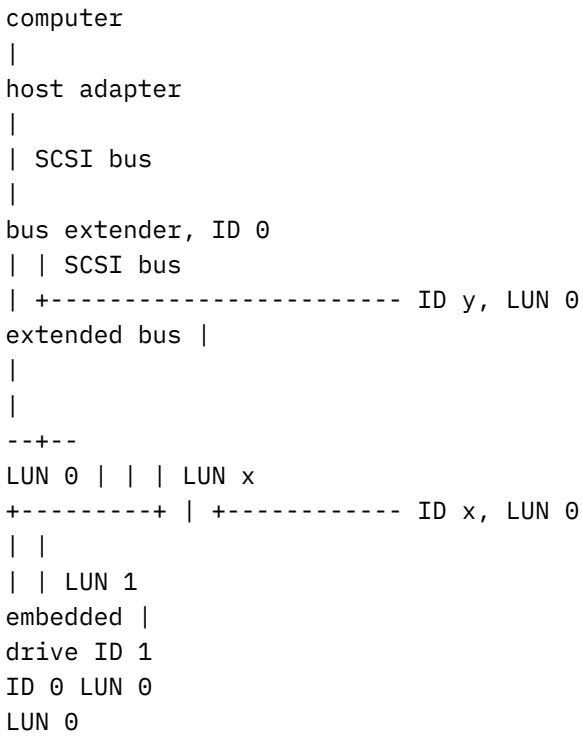
>...and don't forget to change the SCSI-ID of the second drive to another than
>zero (this could be done by jumpers on the HD).

The above looks correct. Just fyi, the "AdSCSI" has no clock, the "AdSCSI Plus" does; this is the difference between them.

Normally with SCSI, you have 0-7 "target IDs" and each target can have 0-7 Logical Unit Numbers. So, you could theoretically have up to 64 devices on your SCSI bus. In the bad old days (}-)) you took an ST-506 hard drive and stuck an Adaptec SCSI controller onto it. The controller was given a particular target ID number, and it could control up to two drives, so it would recognize LUNs 0 and 1. This was pretty common for SCSI controllers, so now your 64 devices is limited to only 16 devices. Nowadays most SCSI devices have "embedded controllers" which means the controller comes with the drive and can only control that single drive. This limits you to only 8 devices per SCSI bus, and the logical units 1-7 can't be used for anything. On other systems you're limited even further, the computer's SCSi host adapter has it's own SCSI target ID, so only 7 other IDs are available for peripheral devices. No ST host adapter that I know of reserves an ID for the adapter itself, although some do reserve an ID for their onboard clock, as mentioned above. (Rather a silly thing to waste a whole target ID on, I'd say. Oh well...)

Since it's not unreasonable for some folks to want more than just 7 or 8 peripherals on their SCSI bus, you can now get a sort of "bus extender" from a few places. What these do is sit between a set of peripherals and the main SCSI bus. The extender is assigned an ID, and any logical unit numbers that go to it are handed out to the devices with the matching target ID behind it. e.g.



This setup brings your theoretical device limit back up to 56 (or 48)...
(The bus extender has to have its own ID on the extension bus.)
It seems these extender devices are only made for SCSI-2, perhaps they
felt SCSI-1 didn't have enough bandwidth to justify it.

>The latest (November) issue of the UK publication Personal Computer World has
>a three page article about the Falcon in it. Chris Cain gives it a very
>favourable review. The machine he had access to was a production machine
>... etc
I thought the review was pretty predictable in that it could have been written
even if Mr Cain never got his hands on a machine. It says that the audio
is impressive, but this was based on the Atari demo at Dusseldorf. He never
actually did any tests himself, it would seem. There were no reports on
the D2D software, or on MultiTos (the screen shots appeared to be from a
machine running SingleTos). There were no compatibility tests for ST software.

All in all, not very informative, I thought. But at least I would agree with
him that 899quid is too much for just 4Mb and 65MB with no monitor. That's
400quid just for an extra 3Mb and a small disk.

Fine, but does anyone know how to teach a modem that kind of "protocol"?
:-(
As far as I know, you need to specially design a modem for that.
And not to forget, there are different standards (if you can call them "standards" at all) throughout the world. (e.g. EDT, Baudot, ...)

with regards
Christian

P.S. I'd appreciate any further info very much.

>
>So, I guess the Internet must be some powerful force!

I'd love to know just how many "many people" is.

Terribly amusing! I can just imagine the consternation at Toad. They have a staff meeting:

"So, how many calls about Mr. Paul did we get today?"

"Six. Stupid computer network!"

This is a much nicer touch of "real world meets the Internet" than the last one I recall (One Dr. Fabrikant of Concordia University, Montreal, sent out a whole REAM of material accusing his department of academic fraud. It wound up posted in one of the Usenet newsgroups. The next day, there were news reports of a hostage taking at Concordia; it turns out he brought in a gun, and wound up shooting several people. There were 3 deaths, I believe. Quite disturbing, to say the least. Pretty irrelevent to this thread, fortunately.)

Heading to a nicer note: I guess this means that people don't need to keep harassing Toad Computers :-).

3589. Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-10-05 12:32:44 UTC
From: leo@dcs.warwick.ac.uk
Message-ID: <1992Oct5.123244.22843@dcs.warwick.ac.uk>
Source record: 216662

I have a few questions about the Falcon.

1) What speed is the data bus and memory (I assume 16MHz)?
2) Can the DSP/blitter/DMA directly access ALL available memory?
3) Can you buy the Falcon in the shops in ANY country yet?
4) Does the #499 UK price still hold after the devaluation of the pound against the dollar? (It should go up to at least #560 if Atari are to keep the same margins).
5) Does the VDI use the DSP to speed up graphics?
6) Are Atari taking advantage of the non-standard RAM boards by overpricing them, if so how easy would it be to manufacture 3rd party boards.

Thanks

- Leo Hendry (previously cstdxas@csv...)

3590. Re: Convert picture formats??? Which program?

Newsgroup: comp.sys.atari.st

Message-ID: <1992Oct5.131853.9037@aston.ac.uk>
Source record: 216679

Gif to mono conversion is really only two or three programs. Gemview is slightly more powerful, but can only save in .IMG format; use a screen dump utility or some such. ViewGif is pretty much as good, but doesn't have as many features, though it saves in DEGAS and is (I think?) slightly faster. MGIF37 is a mono gif viewer; is has masses of features like histogram equalisation, but uses a proprietary file format using flicker palettes; very good results but can only be shown by that program. All three programs are on atari.archive.

From: andrew@minster.york.ac.uk
Message-ID: <718291853.48@minster.york.ac.uk>
Source record: 216677

I understand that Monkey Island II would not be converted because LucasFilm Games did not want to compromise the brilliant graphics and sound that both the IBM and Amiga versions had for the lower standards that the Atari ST offered. The Falcon030 seems to overcome this problem so maybe they could convert it now!!!! In fact I plan to buy my Falcon once Monkey Island II exists for it.

-Andrew

Hmmm.. Maybe I should not compromise myself by buying a game which uses lower quality sound and graphics than my machine can easily manage.

>into that price should be the consideration of the Mac software base,
>reliability of system software, ease of peripheral expansion and configuration,
>and overall product reliabilty and support.

So what? I'm more interested in a machine that runs *ST* software as I have tons of it and am not about to spend hundreds of dollars buying identical applications for a Mac. Not to mention my printer is useless (how come nobody bitches about Apple's printer options, i.e. $400 for a 9-pin d.m. printer is nuts when I already have a 24-pin machine that cost less than half of that!), etc.

>When Apple comes out with
>its PowerPC and lowers its price further, I see Atari hanging on for dear
>life

And I doubt that Power PC will run Mac applications (sorry, if the converse is a public fact, I haven't heard it) so Mac owners will not be any better off.

BTW, a recent survey showed that less than 1/3 of home PC users have any software beyond a word processor, spreadsheet and database. Since these are commonly bundled with DOS clones and Performa Macs, the majority of users really don't care about all the other stuff out there anyway. Face it, the world of PC users is not 100% C programmers. This newsfeed is skewed in that almost everyone in here is from a subset of the population that is morte computer literate than the norm. I build computers for a living, at *home* all I care about is running applications (balancing checkbooks, writing letters and reports, playing chess and MIDI stuff) not debugging code and patching my system every few days.

The fact is I was about ready to spring for a Mega STE. The Falcon is a better deal and since I also play music semi-professionally, the audio capabilities are a real plus. For someone like me who already has an investment in Atari, the Falcon is the best choice. Within a few years I expect the PC landscape will look a lot different (Windows NT, Power PC, etc.) so why should I buy into Macintosh which offers me very little, if anything, over the Falcon for most applications. I'd rather stick with Atari a bit longer then migrate to a new system three to five years from now.

>distribution license for it. The principle author of GDW is Dave
>Baggett who frequents the Usenet, so why not send him email at
>dmb@wam.umd.edu and ask him the real story?

Correction: The priciple designerS *are* Neil Forsyth <neil@cs.hw.ac.uk>
and me <dmb@ai.mit.edu>. As for the real story, you sure as hell got
me. :-/ It's a truly wonderful system that Neil and I have both
poured three years of our lives into -- that's all I can say with any
confidence at this point. You may attempt to call DC directly about
the status of the system in terms of release date, etc. If you find
out anything, let me know. (!)

Dowloadable games created with it are HacMan II, DC Snowball Fight, and
Blox, all of which can be found on atari.archive. They are in some
sense not very good examples, though, because we've spent 98% our time
working on the system 2% on writing the example games, and neither of
us is a professional quality artist. The games are mainly trivial
(albeit time-consuming) examples of what the system is capable of.

3605. Board meeting? ...At TOAD????

Newsgroup: comp.sys.atari.st
Date: 1992-10-05 19:36:04 UTC
From: humphrie@wam.umd.edu
Message-ID: <1992Oct5.193604.5778@wam.umd.edu>
Source record: 216671

A board meeting at TOAD? Yeah right... the owners/partners of toad are still in college. Maybe they would discuss it over SUBWAY subs but board meeting?

By the way.. anyone seen TOAD music? It is in TOAD's old location which is right across the street from the new location. Great CD store. You can listen to CDs BEFORE you buy and sell used ones. TONS of imports!!!

(No I don't work for them... I just know them... I pay the same prices though)

3606. HARDWARE FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1992-10-05 21:47:00 UTC
From: v115lue3@ubvmsb.cc.buffalo.edu
Message-ID: <Bvo4IG.Erz@acsu.buffalo.edu>
Source record: 216687

I have the following hardware for sale:

1 - 520ST, RF modulator, SS drive, mouse, cables, power supplies, etc.
1 - 520ST, upgraded to 1 meg, DS drive, mouse, cables, power supplies, etc.
1 - SC1224 color monitor, cables, power supply.
1 - magic sac w/ 64k mac roms & appropriate software, etc.
1 - Seikosha MP-1300AI high speed business printer, cables, power supply.

If you are interested in purchasing any of these, please e-mail me your offer.
All of the equipment is in excellent condition (keyboards, mice, etc.)

I've heard this also. I just hope that the all-in-one case doesn't scare off so many buyers that Atari isn't able to finance this second machine.

What a horrible error to make the Falcon in this fashion!

For interested Compuserve members reading this, there's currently another poll being taken in the Atari forums there on the keyboard issue.

Does anyone know the address of Digital Data Dreike mentioned in this thread?

>tevans@cs.utah.edu

>Thanks for the help in advance.

I HIGHLY suggest Trancendence, It's easy to use, fairly easy to set up,
VERY powerful, very stable, very configurable, and a shareware version is
available. If you set up the shareware version and you like it, you can
purchase it for $49.00 and get the key file to activate all the features.

If you want to try out the shareware version, mail me, I can answer any
questions (or at least try) that you have when trying to set it up.

If there is enough interest, I can upload the latest shareware version to
atari.archive

BTW, it's being updated regularlly, unlike some other ST BBS programs out
there... for $49 you get way more than your money's worth...

>pc board work I plan to take to a shop.
>
I can vouch for the difficulty of the operation. I managed to kill my 520ST even using a fancy de-soldering station, etc. I had to "blue-wire" about 4 traces to get it to boot again and there are still a couple I need to track down (for example it boots in color with a mono monitor connected). Evidently some of the inner layer traces are as flimsy as the outer layer ones and are very succeptible to heat damage, because none of the breaks were on the outer layer...I also had to use an ohmmeter and a schematic (which didn't correspond exactly to the ST I had).

If you have to do it yourself, cut the 68000 out (I tried to get it out by unsoldering...BIG MISTAKE), use minimal heat to solder suck the holes out, and be prepared to have to find broken traces in any case (ie be fluent with an ohmmeter and have a schematic!)

Don Allison
don@cc.gatech.edu

By the way, does anyone know a place that repairs ST's cheaply? :-) I'm about ready to let someone else find the other broken traces, and I'm looking for a place to upgrade my Aerco Ram card to 4Meg also.

>this...
>

The newer versions of TOS do this already. The disks will read/write in either type of machine without conversion.

If you have an older set of roms (TOS 1.0 or 1.2), the only thing needed is a slightly different bootsector on the disk for it to be usable on both types of machines. You can do this two ways:

1. Format them on the IBM. Use "format <drive>: /t:80 /n:9" to ensure a properly formatted DSDD disk. They will work fine on both machines.

2. Get any of the zillion PD formatters for the ST. I personally use DC Formatter (which can write an MSDOS bootsector to a disk that has already been formatted, with no loss of data) to convert disks that I am already using, ps2form for disks that I prepare specifically for moving files between the machines. Both are on atari.archive.

In reference to 2 above, most programs that have their own formatters also write the correct type of bootsector (Neodesk and Universal Item Selector come to mind).

3616. Object Oriented Programming

Newsgroup: comp.sys.atari.st
Date: 1992-10-06 04:31:50 UTC
From: kllove@bearcat.ecn.uoknor.edu
Message-ID: <1992Oct6.043150.19816@constellation.ecn.uoknor.edu>
Source record: 216685

Please reply by ****E-MAIL****.
Here goes:

Is a C++ available for Atari. I have Turbo C++ v3.0 for the IBM platform, but would prefer to use my Mega 2 to edit files, compile, link, and execute them. I'm just starting with C++, so my programs won't be overly large (no more than 10K source code). Also, some documentation covering Atari specifics (GEM, AES, graphics modes, etc.) would be nice. BTW, I have Lattice verson 5.0, would the documention for its Atari specific stuff be relevent to C++?

Is such a beast available? I'm willing to buy a commercial program if it is well done and has extensive documentation. A shell would be nice too. I'm going to get Gemini from a.a, but a built in shell would be great.

Anyway, I'm looking for suggestions. If anything is at a.a, please specify all files that I will need. I do have a hard drive, so that isn't a problem.

Assume I know nothing about ST/STe/TT/Falcon/etc./etc. internals. You'll be pretty close to the truth of the matter. What book or books would you recommend getting?

adTHANKSvance,
Kenneth Love

3617. Wanted: Full Metal Planet and Populous II

From: pjc@jet.uk
Message-ID: <1992Oct6.081401.2306@jet.uk>
Source record: 216689

I don`t think that a separate falcon group, or groups, is a good idea.

comp.sys.atari.st has a lot of traffic, but I`ve seen bigger. There is a lot of falcon traffic right now, but in a few months the interest will either die away, or ( hopefully ), the machine will take off. If its as compatible as claimed, it would presumably replace the current range of ST`s completely, and would constitute the "leading edge" of atari developments. News tends to either rehash old subjects cyclically, or cover new and interesting developments. With luck, ALL the new and interesting developments this time next year will be falcon related, and c.s.a.st will tend to reflect this.

Basically, I don`t believe that a need exists for a new group, although that doesn`t mean it would be actively harmful. After all, the joy of reading the news lies in finding stuff you didn`t know about already...

Double Click Software.
>The principle author of GDW is Dave Baggett who frequents the Usenet, so why
>not send him email at dmb@wam.umd.edu and ask him the real story?

I just don't have the same 'net profile' as Dave so I don't think he'll mind
if I steal some glory here. :-)
Game Workbench is a joint project by both Dave and myself equally.
I'm primarily responsible for the low level layers concerning image drawing,
scrolling, hardware access etc while Dave's code layers on top the kernal,
which controls sprite animation, screen control etc, and a friendly
programming interface that simplifies game writing as a whole.
As Dave says: "The Unix of game writing".

If you want more information about when Game Workbench will be released then
I suggest you talk to Mike Vederman at Double Click Software.

A quick note about the Falcon (I know no-one is interested but what the hell
:-)
At the moment Game Workbench does not support any of the new features offered
by the Falcon but that will probably change in the future.
However Game Workbench is fully Falcon compatible and will certainly benefit
from the extra speed in terms of sprites and scroll smoothness.

Not so in the UK. 'ST Format' magazine (October) reported that the first
Falcons (base model ie no hard drive) to be on sale in the UK will be in the
old 1040 STe style case, the only noticable difference being that the keyboard
keys are a dark grey, and the FALCON 030 logo of course. (They had a picture).
I don't know how the model with the built in 65Mb hard drive will look.
IMHO this is one almighty f**k up. When I bought my 520 STFM originally I
hated how it looked but LOVED its capabilities, especially MIDI. Jesus, how I
hate those function keys. I only hope Atari come to there senses and give this
machine the professional look it deserves. B-(

Here's some prices I saw in November's issue of 'ST Format' (Yes! Its on sale
NOW!! in the UK). I called a supplier to ask if he had any in stock. "They'll
be in stock in a week and a half", he said.

What about those of us that have no interest in the falcon at the
moment and just want to get on with using and enjoying our ST's ???
Right now I can't afford, and am not going to be able to afford
a Falcon for quite some time... the economy has seen to that here. It's
got to that stage where all these posts about the falcon are boring and
of no interest to me.

I realise that I can just skip them, in fact, that is what I am doing,
but it would be nice if they had their own place to go.
There are a lot of newsgroups a lot quieter than what these 2 newsgroups
would be if it was split.

There is also the other problem of crossposting to consider... I bet that
most messages will end up in both groups for a while.

I asked, but could not get the address of the firm yet. But it is from
Germany that much I found out. When I hear the address I will post it ,
with price info if I can get my hands on that.
What the program does is basically:
design an electronic scheme with all the components and their
connections and then it can also generate layouts from that and some
more things but as I am not a user of this program I cannot tell you
anything more.

Erlend.

I have the same problem. Has anyone gotten disk 2 to load? I'm
running on an 2.5meg ST w/TOS 1.4. Does it work on an STE only
perhaps? or could the file from atari.archive be corrupted (but disk
1 seems to work fine).
Disk 1 was great. I'd like to see and hear what's on disk 2 as well.

From: djp@ecs.soton.ac.uk
Message-ID: <13012@ecs.soton.ac.uk>
Source record: 216695

I have recently taken my OLD Spectre 128 (version 1.9F) out of its
box again (my computer was stolen and I waited a long time before
deciding to replace it - I now have lots of out of date software).

It works great with Finder 6.0/System 4.3, but crashes horribly
when I try to upgrade to 6.0.8 and gets nowhere with 7.

The UK company which sold it originally no longer deals with
it, and has referred me to Gadgets. Of course the 'phone is
continuously busy, and time differences make life harder too.
Can anyone give me an email/fax/... address/number so that I can haggle
over upgrading to the lastest version?

|> CODAC coder (digital to analog (DAC) and vice-versa). One mega-
|> byte per second IN and OUT simultaneously, this allows for expan-
|> sion of stereo inputs for digital sampling or additonal MIDI
|> ports, etc.

I sincerely hope this diagram is wrong! It looks like the DSP is just
tacked on to the falcon like a periperal with no fast DMA to main memory
- no fast 3D vector calculations on objects stored in main memory; no hitting
the screen memory with the DSP for realtime shading/texture mapping; no fast
JPEG/MPEG unscrambling... :-(

Can someone with developer docs clarify the DSP<->main memory/68030 link?
Is there any way for the DSP to transfer data directly to/from main memory
with out the assistance of the 68030?
How is the 32Kwords DSP RAM distributed over the X, Y & P memory areas?

Also what are the new blitter features? does it do 32 bit blits or does it
do 16 bit blits with caching to make use of the extra bus width and leave more
memory cycles for the 68030 or is it just the same old cycle hogging
ST blitter with a double speed clock?

Steven

Hello, I am thinking about learning to program my ST.
At the moment, I haven't a clue how.
So, my questions are...

Which language is easiest to learn?

Are these machine/processor (?) specific?

BTW I am not trying to start a flame war about which is best :-)

Please E-mail any help! (I will post a summary if anyone wants me to)

Thanks,
Phil
(E-mail naffara@uk.ac.crc)

>program. All three programs are on atari.archive.

There are plenty of GIF to SPECTRUM converters in the
PD. Some of them can't handle the size of the original
GIF file so they make an attempt, sometimes successful,
sometimes not. The odd one can be very good. You'd
then need 512:SHOW.PRG, that's PD too.
I'd rather have a GIF to RAW proggy, though.
Somebody write one for us.....

I've just received a demo copy (version 1.4) of the drawing program
Silhouette. Has anybody got any experiences of this program because
the demo gave me a very bad impression and thank goodness I saw the
demo before I bought the real thing. One of the main problems
was how slow it was at picking up the control point for bezier curves.

Herb

PS I have heard that the Falcon is going to be rereleased next Feb in the
UK with a new case and redesigned ciruit board. And whats this about
Atari using cheap and not fully functional 68030 chips? (i.e a pin or
two missing which prevents hardware virtual memory)

SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse ......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I would like to sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it.

PRICE: $650.00 w/o Printer
$700.00 with Panasonic printer. Sorry, I don't remember the
model number. It is Epson compatible however. Hardly
used.

Alesis MNT-8 Sequencer

***** 8-Track, standalone sequencer
***** Small enough to take on a gig
***** Powerful enough to do practically anything you want
***** Includes all documentation

PRICE: $125.00

********This unit is in perfect condition. Again, I would like to sell this unit to someone in the Bay area for the same reasons as stated above.

Reply to this account for further information. Or call me at:

(415) 367-3087 (before 3PM weekdays)

> commissioning software to be written for them than on advertising?

IMHO, Atari has to do both: attract more developers and advertise. If they advertise and promote their computers more they would attract more developers. But they have to do more than this to attract developers: Atari has to support them. Look at the situation with the Macintosh: Inside Mac series, APDA, Develop, ETO, regular tecnical notes, and Apple University to name a few.
And the more Apple support their product, the more support it gets from other souces: Look at all the books on programming for the Mac or on tutorials for different applications.

Yes it is a catch-22. And it is up to Atari itself to solve the problem. Forget "revolution". And forget the new campaign (sorry but I forgot the name) that's been discussed recently. Without Atari's commitment, it's useless.

Unfortunately there are not enough people out there like you who already owns an ST to support the developers. And of those that do, I'm sure a number of them including myself are looking for a good reason to stay with this platform. This is why lots of developers (in the US) have left. When the software environment is stagnant, the users eventually leave.

>(E-mail naffara@uk.ac.crc)

I tried send email, but my mailer choked on the address that was given
in the original post. At any rate, this is just my 2 cents worth...
No flames, please...

C is a pretty popular language, whether on the ST or in general. My
recommendation is that you:

1. pick up a book on C;
2. pick up a book on GEM programming (I haven't bought one in a
while, so I'm not sure what's currently available); if nothing
else, pick up the Professional GEM series of text files, which
are on atari.archive.umich.edu (I think);
3. FTP yourself a copy of Ian Lepore's "Heat 'n' Serve C"
(also from atari.archive)...

The file you want is sozo133i.zoo, and it's everything you'll need
(except a text editor) to get started. It installs painlessly via an
installation program (included), and is very, very easy to use (in my
opinion).

If you've got any specific questions, let me know...

John

Don't forget that the DSP only has an address space of 64Kwords per memory
type (X/Y/P-RAM) and that even if it was possible to connect the DSP in
a DMA-device-like fashion to main memory, the main memory would be much
too slow for the DSP to operate at full speed. The DSP's RAM is 0 waitstate
static RAM (SRAM) at 25 or 30ns (don't know exatcly).

: Can someone with developer docs clarify the DSP<->main memory/68030 link?
: Is there any way for the DSP to transfer data directly to/from main memory
: with out the assistance of the 68030?

I'm not a developer, but I think the above description is more or less
accurate.

: How is the 32Kwords DSP RAM distributed over the X, Y & P memory areas?

As far as I know (from German magazines) the memory areas are all mapped on
the same 32Kwords (96Kbytes) SRAM, so that P-RAM can access all 32Kwords,
X-RAM is mapped to the addresses $4000-$7fff and Y-RAM to $0000-$3fff of
the same SRAM.

: Also what are the new blitter features? does it do 32 bit blits or does it
: do 16 bit blits with caching to make use of the extra bus width and leave more
: memory cycles for the 68030 or is it just the same old cycle hogging
: ST blitter with a double speed clock?

I have no idea, but I've heard it is 4-5 times as fast as the old STe blitter,
so just double clock speed can't be the reason for this.

3646. WAACE show -- who is going?

Newsgroup: comp.sys.atari.st
Date: 1992-10-06 15:30:26 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1asbeiINNctj@usenet.INS.CWRU.Edu>
Source record: 216613

Hi, if anyone is going to the WAACE show, would you do me a favor?

"OPERATION: A.C.T. NOW" has some new registration forms that we would like to get passed out at this show.

I would do it myself, though, I will be very busy this weekend and unable to attend the show.

The only thing that you would need to do is leave the forms some place at the show where people will pick it up.

If you are willing to do this favor, please send me your name and address and I'll have the forms sent to your house immediately through UPS.

THANKS!

Len Stys (aa399@cleveland.freenet.edu)

>technical assistance to anyone or any group that does want to try it.

That should be very nice, to have X run under (over) MiNT. But a few problems
first have to be solved:

1) Memory. Running a complete X setup (server, xterm + shell, application,
window manager) likes a lot of memory. I only have seen this running
on virtual memory systems -- probably the way to go. But this will
exclude all ST models (because of 4Meg real memory limit, and no
virtual memory models). TT, Falcon, ST+68030 can be made to run
with VM. Does MiNT support this yet?
2) Connection method. X likes a decent network to connect server and
clients. Basically, TCP/IP and DECNET are supported (major).
Is such a beast available for MiNT? (OK, for starters sockets may
do. But see 3.)
3) In most business setups networks are heavily used; one of the strengths
of X is (IMHO) the power to run on every machine from your
local display. However, for decent performance one want ethernet,
or similar speeds. Is this available for many ST's? And does
MiNT support that?

OK, to be true -- i should check MiNT again. Last experience with a very
early version.

3649. lh5 extraction and x_shell

Newsgroup: comp.sys.atari.st
Date: 1992-10-06 16:34:11 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1992Oct6.123411.1@sscl.uwo.ca>
Source record: 216612

I've noticed a few posts recently about problems extracting .lzh archives (I assume specifically -lh5- compressed ones). I have lharc 201i and have this installed for use with x_shell, but it still doesn't seem to want to extract .lzh's with lh5 compression! For instance when I try to extract INVDEMO3.LZH it tells me that it can't find /rm.lzh. I think this si a problem with x_shell as I think r and m are switches...right! Is lharc reading the x_shell commands as filenames here? Anyway, any help would be appreciated...x_shell seems quite good if I could get it to work properly!!!

I just attempted to use my new Joppa "Straight Fax" program with my new Sportster 14,400 FAX. The software does not like the modem, it gives me an error message informing me that my Sportster is not a "Type 2" faxmodem. Upon closer examination of the box my modem came in, I discovered that sure enough, my Sportster is in fact a "group 3" modem. How deep doo - doo am I in?

| Hey! That's nice! I didn't know these memory configs would exist! This
| is good news. I found 4 Meg too little, and 14/16 Meg too expensive.

According to Atari, they don't. But I guess someone will find a way, just like they did with the ST. Personally, I am inclined to ignore all advertised prices until the machine actually hits the streets, and *then* see what people charge.

SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **
SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse ......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I will only sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it.

PRICE: $650.00 w/o Printer
$700.00 with Panasonic printer. Sorry, I don't remember the
model number. It is Epson compatible however. Hardly
used.

Alesis MNT-8 Sequencer

***** 8-Track, standalone sequencer
***** Small enough to take on a gig
***** Powerful enough to do practically anything you want
***** Includes all documentation

PRICE: $125.00

********This unit is in perfect condition. Again, I will only sell this unit to someone in the Bay area for the same reasons as stated above.

Reply to this account for further information. Or call me at:

From: jonal@dhhalden.no
Message-ID: <jonal.78.718406510@dhhalden.no>
Source record: 216625

Now that MetaDOS is finally out (has anyone bought it, anyway?) and ICD's SCSIPro is supplied with drivers for anything in the SCSI world, we should be seeing more CD-ROM stuff appearing for the Atari line of computers.

The Falcon will NEED this medium for it's multimedia stuff. Almost any drive should be possible to hook up to it, and we will probably be seeing a plug-and-play kit from PLI anytime soon as they've agreed to include Atari support for their SCSI peripherals.

What about discs then? I've had some mailing going on with Bob at Walnut Creek CD-ROM (cdrom.com) and suggested an Atari specific disc. He's interested, so I'll try to find useful stuff to put on it. The Archive at umich is obvious, as well as something from the German sites. As we also can use bitmaps/PS graphics, fonts, sound and .MOD files from other platforms, I've suggested that the disc could be filled with stuff like this as well.

Does anyone have any more suggestions? Directions to where to get any of the discs that has been put out in the past for our pet machine? I know there should be a PD/Shareware disc out as well as one with clipart. Mail me!

I'd really like to see the media catch on on this platform as well, now is the time for CD-ROM!

If you install a GDOS of your choice , you can use any (proportional)
GDOS Font in CoNnect. There is no reason why this should not work,
cause CoNnect is written using the GEM-standards.

Just a comment - I downloaded this latest Uniterm(e15) from the above archive. I was however dismayed to find that there appears to be a (minor) bug in tis "default" buffer allocations i.e. what you get if you have not saved a UNITERM.SET. Moreover this is nasty in the sense that it can "hang-up" Uniterm in a way that nothing short of a "warm boot" can get you out - or at least so it seemed to me.

Augmenting one of the buffer sizes cures this - but I have to admit I'm back using Version e11. Apparently Versions e12-14 were lost in a massive hard disk crash on Simon Poole's computer some long while ago!.

There are X clients that do not need much memory, MacX comes to mind. These clients aren't wonderful (I know, I've used MacX) but are usable. As always more memory is desirable.

>2) Connection method. X likes a decent network to connect server and
> clients. Basically, TCP/IP and DECNET are supported (major).
> Is such a beast available for MiNT? (OK, for starters sockets may
> do. But see 3.)

Again, X doesn't HAVE to have ethernet or other decent network setup. There are currently several X clients that will run over such slow connections as 2400 baud. And of most interest is that the new release of X that MIT is currently working on has support for slow network connections, no release date yet but supposed to be fairly soon.

>3) In most business setups networks are heavily used; one of the strengths
> of X is (IMHO) the power to run on every machine from your

No argument there. There are ethernet boards available for the ST but as to how widely available and used these are. I don't know if MiNT currently supports such connections.

>OK, to be true -- i should check MiNT again. Last experience with a very
>early version.

I haven't seen a current version of MiNT either, just wanted to pass on what I know of the current state of things in the X community. Anyway, just my $.02 worth.

>

I found this in my diskette box (ST Club GRD*36)

SPECGIF4.PRG converts Spectrum .SPC or .SPU files to GIF files,
320x200x256 colors. When you start the program a dialog box comes up;
it has 3 options: interlace, non-interlace and quit. You'll get
exactly the same GIF picture whether you choose interlace or not; it
only affects the order in which scan lines are stored (interlace
allows you to view a picture online before it was completely
transmitted).

Next comes the load file selector. Choose you Spectrum picture.
Conversion takes about 7-8 seconds and then you gethe save file

selector. You can simply click OK, since the program automatically
changes the filename extension to .GIF . Note that if you change the
pathname when saving, it's remembered separately from the load
pathname. Makes it easy when you want to convert a lot of pictures,
let's say from SPECTRUM folder to GIF folder. When the file is saved
you return to the startup dialog box; you can choose to continue or
quit.

Boris Tsikanovsky
Trio Engineering

I assume that it is on an archive somewhere, although I could not see
it when I quick ly looked throught the cs.ruu.nl listing. If it is
not available, I could post it. Where?

BTW the program is less than 6K.

Strange... this is apparently another case of the Perpetually Procrastinated Product. I spoke to a representative of Atari Benelux at the Atari Messe, and I was told then that the Falcon would be on sale in the Netherlands by the end of this year. I sincerely hope we are not entering another phase of "Real Soon Now" marketing.

Anyway, in Germany they are supposed to get their Falcons earlier than we, so hs anyone seen Falcons for sale yet there?

Hi,

According to Wolfgang (the author) just about any GDOS should work, so if you get NVDI (best), FontGDOS, AMCGDOS, etc. (but for all but NVDI, I would strongly encourage you to get a screen accelerator ala warp9, etc.) that should work just fine. Especially if you use a proportional font (for those lucky few who have FSMGDOS) you can specify any point size you want.

BTW, I use Warp9 (I don't have access to NVDI) and the only odd behavior I have noticed with it is a blinking cursor in the top left corner that just sits there and blinks. This maybe a problem fixed by the patches, so I'll have to see if its still there... Other than that, Warp9 works fine, and allows me to load in nice-looking fonts (although they are all resolution dependant and either 16x8 or 6x6...or is that 8x8...anyway, it works).

Hello out there!
I thought I could post this here.
I wrote a game for the ST, once upon a time, and I sold it
to START magazine. Obviously, you had to sign copyright agreements
etc. Now START has been defunct for a while. Does the
copyright return to me, could I upload the game to
atari.archive? I know that probably nobody would care about
this anymore, but maybe someone knows about this?
(PS: the game is Slither, previously known on the Apple II as
Snakebyte).

Do you have the source to speech.tos? Or even full documentation? I remember S.A.M on the atari 8-bit, and you could do some neat things in phoneme mode. Speech.tos has such a mode as well, but I have never seen any real documentation for it (the default mode of "type english and hear it" can be vastly improved on when in phoneme mode, as you can adjust the inflection on each sound).

There's a 3rdparty company called "X/software" who did a port for the TT so
you can use your TT as X11-Terminal, in TT med color or TT high b/w resolution.
If you want more than a terminal, you can get a TT with ASV running X11/Motif,
but I recommend getting a 386 or 486 with Linux instead, it is much cheaper :)
BTW, the Falcon030 is definetly no machine (compared with 486, 68040 or RISC
CPUs) with enough performance for Unix or X11.

Regards, Markus.

MiNT doesn't support paging or swapping yet. At this point, I think swapping could be added fairly easily, but I'm not sure I'd want to run that way.

>
>OK, to be true -- i should check MiNT again. Last experience with a very
>early version.

2 and 3 seem closely related. MiNT currently does not support sockets, tho it does have uni- and bi-directional pipes. Wrapping a Unix-domain socket interface around this would be trivial at the library level, which would at least get you running with server and local clients. Full internet socket support would be nice, but requires a lot of work and a lot of code. Also, the only interfaces one could reliably expect to be available are the MIDI port, centronics port, and 68901 serial port. On the Mega STe and TT you add the Z8530 serial ports, but there doesn't seem to be any standard for the available ethernet hardware. The best approach to addressing this problem would be to collect all the ethernet boards that are available and try to develop a functional equivalent to the Packet Driver software interface standard that's used on MSDOS. There is PD code available to support ethertalk and most of the Appletalk protocols. I don't know of any PD code that directly implements Localtalk, so running localtalk on the 8530 ports is still a problem... For the rest, all you need is someone with a bit of knowledge and enough time. I'm sure someone with a copy of the

Inside Appletalk book could cover the last hurdle as well...

You can also find the list in our Atari archive.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'ARCHIVE LIST' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/ST-ARCHIVES

--> How to get 'ARCHIVE LIST' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

```
begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/ST-ARCHIVES
end
```

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

```
send HELP
```

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

```
send ls-lR.Z
```

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

Ate Brink

Probebly a BASIC, but I'd say that when that is mastered move on to a 'c' compiler and then anything you can't do in one can be done in the other.

I'd recommend gfa basic or fast basic (fastbasic has a in-built assembler, but gfa is quicker/nicer). - both are about 35 pounds.

You can pick up sozobon C at 'a.a' and I've found it pretty good.
(go for sozo133i first then when you feel the need upgrade to sozobon2, as the first auto-installs etc)

An X server should run in 4 megs, but I agree that a complete setup will take more than that. MiNT doesn't have built in virtual memory support (yet), so either one would have to have enough real memory (there are TTs with 16Mb and even 64Mb of fast ram) or use one of the virtual memory products like VRAM.

> 2) Connection method. X likes a decent network to connect server and
> clients. Basically, TCP/IP and DECNET are supported (major).

X also can use shared memory, and for local connections that's the fastest way to communicate. MiNT has shared memory built in. No networking is built in to MiNT, but it should be possible to write a network (MiNT allows file systems and device drivers to be loaded at boot time; it also provides 2 way fifo's, so a program could even be written to make the network connection look like a local pipe, I think).

3686. TOS 2.06 & OXYD2 -> problems !?

Newsgroup: comp.sys.atari.st
Date: 1992-10-07 11:24:06 UTC
From: andi@gmd.de
Message-ID: <andi.718457046@gmd.de>
Source record: 216648

Hi, netters!

After upgrading my old 520 ST+ to 4MB and TOS 2.06 and supplying it with a hardware clock, I discovered the following problem with OXYD2:

When the menu shows up, there is a section in the lowest part of the screen where you can see some graphic symbols black on white overlaying the menu. When you start the game, this 'symbol-panel' starts flickering with every movement of graphic on the screen.
The game still works, but it's not much fun guessing what's happening below this 'panel'. The same happens with OXYD and SPACOLA, so the problem seems to be originated in this special kind of software.
Assuming a hardware fault, I went to my local dealer, who had done the upgrade. He checked everything twice and didn't find any defects. I guess it has something to do with the new TOS.

So I decided to post this query to the net. Maybe some of you had similar problems with this software and know a solution.

Thanx in advance,

Andreas Rohrschneider.

P.S.: STADT, a painting program from Application Systems Heidelberg also doesn't run anymore. I only get a messed-up screen and some bombs. Any suggestions ?

3687. Things I'd like to see in MiNT...

Newsgroup: comp.sys.atari.st
Date: 1992-10-07 11:39:17 UTC
From: boender@dutiws.tudelft.nl
Message-ID: <2192@dutiws.tudelft.nl>
Source record: 216556

```
Hi,
some things I'd like to see in MiNT:
- core dumps for programs that crash (if set... not for ALL crashes)
- shared libraries (if we have shared text in programs, we also should have
libraries shared. Like, uhm, Suns or the Amiga).
- swapping for large programs. G++ is far more usable if it swaps. I don't
want all programs to be swapped, just some large programs that have the
'swap' bit set in the header.
- /dev/audio, /dev/speech device drivers.

Could hope for more, but this seems to be possible on STs.
Bye, Hildo Biersma
```

Source record: 216552

This might be a stupid remark but once the Atari machines are powerful enough we could actually have them run X and then define the AES (and VDI) in terms of X. There exists a program for X windows (UNIX) that emulates GEM (either TOS 1.4 or DOS 5.0 I think) based on X windows. It's called X/GEMonX. If this is done smartly both GEM and UNIX X windows programs can easily be run/ported to the TOS/X system.

I too would recommend fast basic, particularly if you can get the cartridge version. Personally I have always found assembly language on the 68k series to be very easy to code and I almost always write pure code for my applications, but obviously this wouldn't suit everybody. The assembler that comes with fast basic is pretty adequate but not wonderful, although I find that the mix of an interpreted basic and machine code is perfect for program development.

I must agree with him wholehartedly. C is the best way to go (Easy enough to learn, and it's the one that lets you use the ST's power the most).

As for books, I'm not sure if they are still in print, but I find that the Abacus books ("Atari ST Internals" and "GEM Programmers reference") are your best buy.

Patrick.

>>Indeed, I'm quite sure that X could be made to run under MiNT.

Forget it! I'm quite sure that X could be made run on the ST, thanks to the great job that Eric has done with MiNT.

BUT: The performance would be lousy. One of the great weaknesses of X is the big overhead when you run clients and server(s) on the same machine. A native OS that goes directly into the screen HW will be faster every time (cf the "cheat modes" that vendors like SGI or now Sun have built into their xlib, the lib will go into HW if it detects that the client runs on a console server).

>2) Connection method. X likes a decent network to connect server and
> clients. Basically, TCP/IP and DECNET are supported (major).
> Is such a beast available for MiNT? (OK, for starters sockets may
> do. But see 3.)

That's the point. IMHO it would be VERY nice to have an Atari run an X server only, to be used as a cheap X terminal, like PCs with VGA cards are when they are connected to ethernet.

BUT there's work in progress for X11R6 that includes X over serial lines. There is a new protocol developed by X term maker NCD that aims to minimize protocol traffic across the connection. This is where a falcon comes in: Take a fast color X and PEX server on a - say - 17" screen on a falcon hooked up via serial line, and you got a winner.

Today, the X server for STs is expensive and requires ethernet.

3692. Re: New Mac Prices tough on Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-10-07 13:04:23 UTC
From: Mark Kovarski <kovarski@zooid.guild.org>
Message-ID: <1992Oct7.130423.15499@zooid.guild.org>
Source record: 216581

The big question is, will Atari survive? Considering the circumstances, there is very little hope for this company. Apple will release their new line of computers with on-site service (they will even come to your home to get the work done). In a very recent "Keyboard" Magazine article there was NO WORD on any Atari but Windows and Mac software. Motorola, IBM, and Apple will release the new SuperPC in a very near future (1993). Prices between $1000-$2000 it will contain the new processor developed by Motorola and IBM (601) which is a very close 'friend' to the one used in the IBM RISC/6000 system. Motorola is very close to release the technical data on this processor, according to one Motorola employee. The RISC system will be priced from $1000 to $2000 and the processor will carry the price of approx. $50. Furthermore, Intel will release the 586 in the 1st quarter of 1993 followed by a new processor every two years. The development for the 786 started already in early 1992.

Amiga has also released their new computers but at prices that I personally heard, they will be a big flop, in particular the 4000 model. Commodore has also financial problems and I believe that those two new computers will not get them out of the crisis.

The best thing for Atari Corp. is to sell the company to _RESPONSIBLE_ people that really care about the company.

Regards,
Mark K.

I purchased a Chinon drive from Toad Computers recently. As a developer I have had access to metados2 for over a year. The combination works great. I have had some problems when the directory has a very large number of files in it, in excess of 200. After 5 or 6 accesses of the directory the system hangs. directories with under 120 files seem to work OK.

I have tried this on both my 520ST and my TT.

I have ordered, and received, several disks from Walnut Creek and I am pleased with them. The GIFs Galore is a very good disk, but has more than 200 files in some directories which lead to some re-booting.

I have spoken with ICD about their new Host-Adapter software. They have made several changes to metados to relieve this lock-up problem, I should have the disk in a week or two. I'll post a mini-review of the how this new software works after I've had it a week or two.

I just discovered (over the weekend) that Philips is using "PIM" to stand for "Philips Interactive Media", i.e., the new CD-I system. As a matter of fact, the Philips US subsidiary that will promote CD-I is named PIMA (Philips Interactive Media of America).

IMHO, Atari should find themselves an acronym other than PIM. Possibly the one noted above - or not. :-)

SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse ......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I will only sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it.

PRICE: $650.00 w/o Printer
$700.00 with Panasonic printer. Sorry, I don't remember the
model number. It is Epson compatible however. Hardly
used.

Alesis MNT-8 Sequencer

***** 8-Track, standalone sequencer
***** Small enough to take on a gig
***** Powerful enough to do practically anything you want
***** Includes all documentation

PRICE: $125.00

********This unit is in perfect condition. Again, I will only sell this unit to someone in the Bay area for the same reasons as stated above.

Reply to this account for further information. Or call me at:

3698. ST->Unix Zmodem won't resume

Newsgroup: comp.sys.atari.st
Date: 1992-10-07 14:37:25 UTC
From: selick@csa.bu.edu
Message-ID: <97861@bu.edu>
Source record: 216557

I've been using zmodem for years now, and I have done thousands of transfers in both directions from unix to st and st to unix. From the unix to the st (downloading) the atari will always resume a previous transfer no matter what command line I use. When transferring from ST to Unix, it won't ever resume a transfer, no matter what command line I use. I am running Uniterm 2.0e, and I have tried all of the zmodem programs available at a.a. I assume it's not a problem with the unix program, but perhaps something I'm doing/not doing with the command line(s)?

Please e-mail responses to selick@csa.bu.edu

3699. Falcon040

Source record: 216569

Hi all,

following the recent discussion about TeXDraw, I received the sources
from the author Jens Pirnay, who declared them public domain.

The sources are in Modula-II (from Maxon, I believe).

As has been pointed out, there should be ideally one person taking
over responsibility or at least one coordinator for new developments,
which, I hope, will take place.

It's up to you gurus to take it over.

The stuff is available through

atari.archive.umich.edu in /pub/atari/New
ftp.tu-clausthal.de in /pub/atari/incoming
ftp.uni-paderborn.de - " -

as td187src.txt and td187src.lzh. The sysops are notified and will
place it accordingly.

If you are seriously interested, contact the author via email by
<jens.pirnay@rphs1.physik.uni-regensburg.de>

Enjoy,
Thomas.

According to Bill Rhebok (or rather the technician with him...darn I keep forgetting his name) at the Glendale Atari show, the falcon's DPS has all the pins that the '030 has, including 32bit address and 32bit data, which implies that even though 24bits are used for memory, and the rest left unimplemented for cost reasons, it would be possible to not only put an accelerator in, but also add memory with the accelerator board. You would probably have a model similar to the TT split mem model as the extra memory would not be (necessarily) available to any device except the new CPU - the TT supports TTram better than this though. Actually I am tempted to say that the extra memory cant be accessable by the other devices, but I suspect the DSP can access 32 bits address, and of course if you have ever followed the history of Atari 3rd party developers at all, you will note that they enjoy doing the "impossible". :)

On the subject of monitors for the falcon, my current set up (for my ST) is an SC124 for working on, and a Sony Trinitron connected via scart for any colour stuff. With the sony in that configuration, should I be able to get overscan+true colour on the falcon? Also, how will a vga monitor compare to the SC124 - I don't want to have to keep 3 monitors in use, so I'd ideally want to use VGA for working, and the sony for any colour stuff the monitor can't handle. Would there be any more eyestrain from the VGA monitor than from the SC124?

Source record: 216567

As a first programming language I normally would not recommend C. But
I agree that C offers the best access to the power of GEM. The compiler
I recommend is Mark Williams C. It comes with a command shell, micro-emacs,
archiver, make and several useful utilities. It does not come with a source
debugger, it is available seperataly though it is not the best.

MarkWilliams C (MWC) compiles K&R C not ANSI, but does come with the
best documentation for an ST, that I have seen. MWC is also very easy to
install, works well with a Ram-Disk and no HD. MWC is no longer being
produced but there are copies available. Atari used to include MWC in its
developer kit, I'm not sure what they are shipping now.

I currently use PURE C, and recommend it highly to someone that either
has MWC, or Atari's developer kit as reference material. The orignal name
of PURE C was Borland Professional C. Borland dropped support but sold the
source code rights to a German company with the stipulation that they NOT
translate the manual to english, so you sometimes have to fight the manual
to find the information you need.

Either of these packages will meet a beginners needs. Though if you purchase
PURE C you will still need to purchase a set of documents that will allow
you to program with the AES/VDI.

So it would be possible to put up a network? HOw hard would this be
to write? Anybody want to do it? The reason I'm asking is that sometimes
it would be nice to be able to setup a network between ST's. And the
network program at Atari.archive is not very good at this, and very
crash prone. I've used MiNT and seen how reliable it is, even with my
lowly 1meg ST. I do not have the knowledge or skills to write a
networking scheme.

Later.......

Because nowadays, any IBM gamer with a little extra cash (which is most of them)
has a Soundblaster card, or something similar to enhance their sound output. The
Soundblaster, while it's not the greatest sound I've ever heard on a PC, is
still pretty impressive.

Get yourself a copy of Rend512. It's similar to RezRender, but superior in that
it renders objects into Spectrum 512 format, with the full Spectrum palette,
instead of RezRender's 16 colors. I think there's a demo copy on a.a.

SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse ......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I will only sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it.

PRICE: $650.00 w/o Printer
$700.00 with Panasonic printer. Sorry, I don't remember the
model number. It is Epson compatible however. Hardly
used.

Alesis MNT-8 Sequencer

***** 8-Track, standalone sequencer
***** Small enough to take on a gig
***** Powerful enough to do practically anything you want
***** Includes all documentation

PRICE: $125.00

********This unit is in perfect condition. Again, I will only sell this
unit to someone in the Bay area for the same reasons as stated

above.

Reply to this account for further information. Or call me at:

>to START magazine. Obviously, you had to sign copyright agreements
>etc. Now START has been defunct for a while. Does the
>copyright return to me,...

According to information I read on GEnie when STart went under, the copyright should indeed return to you, unless there is someone who has purchased the rights from STart. As STart went under owing a lot of authors, I don't beleive you'd find anyone willing to step forward and claim ownership of their copyrights, as that would imply they also accepted responsibility for the obligations. Do you have a contract? I'd think there'd be some kind of clause covering just that somewhere in there.

Of course, I'm not a lawyer, and don't play one on the net (when I can help it), so if you're really worried, why don't you ask someone in law at Harvard? I'd imagine someone in the law program there could give a more authoritive opinion.

>Hi,
>some things I'd like to see in MiNT:
>- core dumps for programs that crash (if set... not for ALL crashes)

Yeah, would be nice, I suppose, could make debuggers more useful. Another possible benefit would be to support process migration over a network. I had forgotten about this possibility before, but with a bunch of STs sharing a SCSI bus it wouldn't be bad.

>- shared libraries (if we have shared text in programs, we also should have
> libraries shared. Like, uhm, Suns or the Amiga).

Working on it. Requires more hacks to the compiler and linker. I think this will be of limited usefulness as long as people are using many different compiler systems. But, I suppose if everyone standardizes on the MiNT library, the choice of compiler becomes less important. Right now I'm concerned that multiple libraries are required, i.e., you need both a 16-bit int and 32-bit int version of nearly everything, which sort of reduces the memory savings derived from using shared libraries in the first place. I have most of the compiler issues resolved already, the linker is another question, and I haven't written the dynamic loader yet. Whether that should be intrinsic to the MiNT kernel, or just a separately loaded TSR is an open question. Also, using shared libraries instead of static bindings imposes a slight performance penalty - calls into the library must be done indirectly, and library code must reference global data indirectly.

>- swapping for large programs. G++ is far more usable if it swaps. I don't
> want all programs to be swapped, just some large programs that have the
> 'swap' bit set in the header.

I don't understand how swapping would make G++ more usable. Paging, perhaps, but that really requires an MMU, which means 68020 minimum. With the current shared text support, all that's needed is the addition of a sticky bit and program load times will drop a fair amount, assuming you have sufficient RAM. With less than 4M, sticky text wouldn't help you much.

>- /dev/audio, /dev/speech device drivers.

I guess that discussion has already occurred, eh?

> exclude all ST models (because of 4Meg real memory limit, and no
> virtual memory models). TT, Falcon, ST+68030 can be made to run
> with VM. Does MiNT support this yet?

a) I have a friend who has X11r4 running RELIABLY and fast enough for non-intensive programs on a 386, 25MHz with 4 megs of memory (over Linux yet).

b) VM does not always require hardware VM. His system is into swap space after his first or second window... but it isn't too slow.

>2) Connection method. X likes a decent network to connect server and
> clients. Basically, TCP/IP and DECNET are supported (major).
> Is such a beast available for MiNT? (OK, for starters sockets may
> do. But see 3.)

c) Ethernet is nice for that... why shouldn't the Falcon/TT have it? I don't see it as a problem.

-Hey hardware hacks, E-net do-albe?

d) you can do some X junk over a fast modem too (minimal). They do it here at work.

>3) In most business setups networks are heavily used; one of the strengths
> of X is (IMHO) the power to run on every machine from your
> local display. However, for decent performance one want ethernet,
> or similar speeds. Is this available for many ST's? And does
> MiNT support that?
>

e) Business is not the only user of X. For instance: I want X because it is my OS/GUI of preferance and I would like to be able to work with it at home (development etc). I am sure there are jillions of other uses for X even without a large network/ server. I do agree that the networking of X is a great strength.

>Klamer

(Thanks for your input. I was wondering what others thought about X.)

I think X has a place on ANY system that is powerful enough to run it. One thing about X: you don't have to BEG for developers or pay for the OS... X is THERE and basicly FREE... software is next thing to totally UNIVERSAL under X. Perfect for ATARI who can't seem to keep any large software developer around.

3719. Is there YAPP protocol for ATARI ST HAMing?

Newsgroup: comp.sys.atari.st
Date: 1992-10-08 01:39:51 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1687912297.C556212@mizzou1.missouri.edu>
Source record: 216575

I have a friend I promised to help with his HAM modeming. He says that he needs YAPP to do any d/loading from the radio, but he can't find a YAPP for the ST. I figure if it exists, you guys would know about it.
Also, he has AT speed but can't get it to work through the RS232 port. Says he tried playing around with different COM port selections, but there was never even a voltage raise on the RS232! YAPP is popular on the IBM (I guess), so if he could get either going he would be happy.
Anyone have any leads for me to follow?
Thanks in advance........

Jeoff Hines c556212@mizzou1.missouri.edu

Your code compiles fine with Comeau C++ 3.0 With Templates.
An quick eye scan reveals nothing wrong to me either (although you are better off not using "\n", but instead '\n' or endl).

>this...

Assuming that the situation is that you've arrived at a PC with a disk that you formatted and wrote to on an ST, and now you can't read or write that disk, here's what to do (and yes, this is from personal experience).

Fire up a suitably tolerant sector editor (I use the one from the old bbs-distributed ULTRA utilities. At least one version of Norton Utilities does NOT work, but others may). Read in the first sector on the floppy (this is where sector editors which are not suitably tolerant balk). Change the first 3 bytes to EB 34 90 (that was 3 bytes of hex. They would normally have been 00 00 00 when you read the sector). Write the sector back to the disk. It will now work normally on PCs and compatibles.

Codekeys from CodeHead Technologies.

I don't have it, but those that do swear by it.

(NeoDesk 3.0 also has macro capabilities, but those are only limited to NeoDesk,
not system-wide like Codekeys.)

I assume you mean an SM124 (original Atari monochrome) - the SC1224 is color
and there's no such thing as an SC124.

>colour stuff. With the sony in that configuration, should I be able to get
>overscan+true colour on the falcon? Also, how will a vga monitor compare to the
>SC124 - I don't want to have to keep 3 monitors in use, so I'd ideally want to
>use VGA for working, and the sony for any colour stuff the monitor can't
>handle. Would there be any more eyestrain from the VGA monitor than from the
>SC124?
>
>Kev

1) Yes, you should be able to get true-color in all the modes (in fact, you
get all the modes, period) in your Scart configuration. You _will_ have
interlace in some modes, but you can at least use them all. Oh, and you
can do overscan with this type of monitor.

2) A VGA monitor (assuming you get a 640x480 which really is the cheapest
VGA monitor you can get anyway) will give you good, non-interlaced graphics
in all modes the Falcon offers. The picture should be just as good as your
SM124, _and_ give you color capability to boot. There shouldn't be any more
eyestrain, really.

3) The nitty-gritty : You can do all modes really well with the VGA monitor,
except you can't do high-res true color, and the overscan is faked. So,
if you get the VGA monitor, you can drop the SM124, but perhaps keep the
Sony if you really want to see the 640x400 (768x480 with overscan) in true
color.

Cheers,

Ben Gilbert

Have you ever checked when these books were made?! They are too old to be any good, and if you want to program STE, TT and Mega STE, you won't find any info about theses machines in the Abacus books. The best book you can buy for money, is certainly the Profibuch. The problem is that it is German...

I don't agree. GFA basic offers full access to GEM too, plus it
offers some powerful and convenient commands and functions to
handle GEM without having to worry about low level stuff (e.g. to
create a menu you just put the menu titles and items into an
array of strings and then you do a MENU x$()).

Does anyone remember the hype about the conversion of the arcade game Outrun to the ST and other computers? If I remember correctly there was some ridiculous delay between all the hype and the game actually being out (6 months of so?), although from the shows I went to this didn't stop the distributors from taking hundreds of advance orders. Sadly the conversion was one of the worst I've ever seen (if I remember correctly).

Not that I was reminded of this by all this hype about the Falcon or anything....

Mark

P.S From what I've heard so far, I'd love to have a Falcon by the way. I've even got a piece of code that was orignally written for the ST, but had to be shelved due to lack of CPU speed, that has just been waiting for this sort of machine to come along.

> discovered that sure enough, my Sportster is in fact a "group 3" modem.
> How deep doo - doo am I in?
> Bill

It depends whether the fax program will support Type 1 faxes.
(Incidentally, the Type 2 standard has not been settled, and anything
which claims to be type 2 is actually set up according to the EIA
provisional spec., which was rejected by the industry.)

Tell the program that you have a type 1 faxmodem, or try sending the
modem the command "AT+FCLASS=6". This may switch it into Type 2 mode
(It does for my Zyxel)

Group 3 is a compression standard for faxes - compression along
the scan line.
Group 4 is 2 dimensional compression. (ie - dependent on the previous
and next scan lines.)

The fax program that I use on my IBM handles group 4 in software.
(I don't bother using my Atari for fax work)

Well, the only reason I hate the function keys is because 9 times out of 10
I 'd hit two at the same time. I don't know if its just down to my manual
dexterity (or the lack of), or the diagonal orientation throwing off my
coordination or the lack of space between the keys or the fact that they're
completely flush with the casing or ..... maybe I just have a mental
block against diagonal keys!!

Grant.

Fnordadel is EXCELLENT. It takes maybe 10 minutes to set up, and then can run pretty much forever with no maintenance. STadel is the old version, and has some problems... The only problem with any Citadel is doors. If you want to use doorgames, you're going to have an uphill battle... Mail me if you need help with doorgames, I've got 5 running right now (including several Forem-only doors)

As a beginners compiler i would NOT recomend MWC. Yes, the documentation
is impressiv, but Lattice C V5.5 has even better documentation, and is much,
much easier to set up than MWC. It supports ANSI C and compiles almost
everything writen in/for GNU C with little or no modification!
Lattice C5.x is available in both German and English from HiSoft!
(Only thing i don't like about Latice C is the debugger)!

>I currently use PURE C, and recommend it highly to someone that either

What kind of ST do you have now? What do you use it for? What kind of Mac are you thinking about getting?

To be honest, one really doesn't need to know about the Falcon until they're in the stores and you can buy one.

In terms of a 'falcon board' so you can find out more abotu the computer, there is one. It's called GEnie. ;^) But everyone is just speculating and guessing at this point since you really can't buy one.

Atari's been in worse conditions before. People have been saying for years that Atari won't survive. Well, surprise, they're still here.

"Experts" have been saying that Apple won't survive. I read in Microtimes' 100th issue today that they don't think IBM will survive past the next 200 issues. They say that IBM will enter the clone market and become extinct. Yeah, right...

> or less please contact me.
>
If you're looking for a 20 meg hard drive you can get one new
for arround $70.00. Look in Computer Shopper.
By this I mean a bare drive but you can build one real cheap.
Try some of the IBM shows for a case or a used one...I paid $25.00 for
mine....The host adapter is another $75.00....and misc cables are about
$10.00.
You're now at aprox $170.00 and have room to expand if you buy the
right case....You're not stuck so when you do get a little extra cash you
can upgrade for the price of a bare drive.
Putting it all together is fairly simple also....It might be a
alternative.

Kevin

>
>What a horrible error to make the Falcon in this fashion!

Well, aside from the cost issue that has been pointed out before (which may of may not be a lame excuse), I can think of one possible reason for the all-in-one design of the Falcon: musicians. Not being one, I can only guess, but it seems to me that it would be much easier to carry around and set up a one-piece machine for playing shows. Whenever I see a computer on stage, it's usually a laptop, so I guess the fewer the number of pieces, the better.

Any musicians out there who can confire or deny my suppositions?

That's very interesting. I hadn't though of that! I have a feeling that
Atari also hadn't thought of that. Most musicians who use computers for music
(like me) use it only for recording and MIDI, and they don't take it to
gigs. I imagine that someone wanted to bring a computer on-stage, it would
be convenient to have an all-in-one construction, especially if is is being
used for signal processing or direct to disk live recording. How about
a FalconBook?! THAT would be useful!

According to Bob Brodie, this was THE major reason for the case design.
They've had lots of input from musicians (the Falcon's initial projected
market), most of whom prefer the STfm/e case design. Hopefully they'll
have a case design for the rest of us shortly... I've heard many
different things about that...

MacRead is the predecessor to MacSEE. I've never seen MacSee, but it's supposed to have a GEM interface. MacRead is only text. MacRead is also in the public domain. I don't know if it's at atari.archive though.

I'm not into the Mac<->ST stuff so I don't know how either perform.

Oh no. One flexible keyboard cable is definitely preferable to lots of cables
going out of the heavy all-and-the-keyboard-as-well-in-one unit.

There is one point in what you say though; that is I'm writing a program
for musicians that doesn't use a CRT so the ONLY thing you need is a power
cable and MIDI. The program uses (user definable) LCD displays of remote
MIDI devices.

This is why most musicians tend to use Ataris in the studio (if the Atari gets tired you just go and get a cup of coffee) and Macs on stage. The SM124 is absolutely unreliable and can drop out any moment if it gets too hot or too cold. The Macs seem to be a lot less critical.

Just buy yourself a 13-pin to scart monitorcable made for the atari.
Contact your nearest dealer. I am using a Philips tv/monitor with my Atari
it works fine. I paid NOK 250,- which is about 25 pounds.

3773. GCC / G++ setup again

Newsgroup: comp.sys.atari.st
Date: 1992-10-09 14:03:55 UTC
From: saj@chinet.chi.il.us
Message-ID: <BvuxqK.B68@chinet.chi.il.us>
Source record: 216472

I have a 3-layer request. First, would someone please post an explanation of how the new gcc (2.2.2, if I remember right) relates to the g++ libraries and headers that are already on atari.archive. Does it use them? What goes in which directory? Same thing for mntolb and its headers.

Second, once this gets explained (no matter what anyone says, it's sure to be argued over for a while. By the end of the process, one hopes that an answer that's both correct and unambiguous will result), could this be put in the FAQ. Preferably, if any new releases of things look like they might alter the answer, someone(s) could try to get the word out on what has and hasn't changed.

Third, it sure would be nice if a small text file on recent installation instructions always lived somewhere in the Gnustuff directory at a.a.u.e. Covering, if possible, the entire GNU suite. It would spare the net a lot of garbage postings like this one.

It is not useful or appropriate to tell me to RTFM. I have. It's out of date, and fragmented. Or rather, with all the hands working on keeping GNU stuff current on the ST, the world is fragmented. I'm asking for a central location to look to find out how things stand ->now<-.

There would be more justice in telling me to "Use the Source". But I'm not directly on Internet, so collecting all that source and keeping it at current revision levels is an expensive exercise, requiring a lot of favors from better-connected friends and the net at large. And a central reference would help lots of people.

3774. Uploaded ARC version of perfpich v1.1 to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-10-09 14:38:17 UTC
From: selick@csa.bu.edu
Message-ID: <98107@bu.edu>
Source record: 216538

After the whole stink about the self extracting zip file I sent a while back, I re-did it with good o'l arc, and uploaded it to terminator.cc.umich.edu in /New. Perfpich is a program that requires at least one midi keyboard and one tone generator. If your keyboard can turn off local control (use its internal tone generator through midi only, while sending out keyboard info) then you can use your keyboard alone. The object is to build your speed at determining pitches by finding the note the computer plays without hearing the keys you're pressing.

3777. Summary of "which programming language"

Newsgroup: comp.sys.atari.st
Date: 1992-10-09 15:26:12 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Oct9.152612.8200@crc.ac.uk>
Source record: 216541

I think it is about time for a summary.

First, I must say a *BIG* thank you to everyone who responded!

From what I have heard, "assembly" is the fastest, best to use etc.
BUT, it is also the hardest to learn. (Not for me :-))

Next comes "C" which a lot of people suggested but again this sounds a bit too difficult for complete beginners (like me). Most of the people who suggested this sounded like they had been programming for a long time. I think this would be a good choice once you have got the hang of something easier.

For beginners, a "BASIC" sounds like the best choice. The most popular was GFA basic v3.5. This is supposed to be easy to learn and use. Some people said that the original authors have stopped updating and supporting it, but it was also said that somebody else had taken over the rights to it. (correct me if I am wrong)

(There were also some other languages mentioned, like PASCAL for example)

After some thought and a look at some adverts, I think I will go for Hisoft Basic 2, which is 'easy to learn' and says it's Falcon compatible (I *am* going to get a Falcon as soon as possible!).

If anything I have said is wrong, feel free to correct me! I am only going by what I have been told.

Thanks again for the help,
Phil
(E-mail naffara@uk.ac.crc)

3778. Falcon operating system...

Newsgroup: comp.sys.atari.st
Date: 1992-10-09 15:55:14 UTC
From: andrew@minster.york.ac.uk
Message-ID: <718646113.15685@minster.york.ac.uk>
Source record: 216548

I've been reading many articles about the Falcon's graphics, sound and hardware capabilities. I've even read a long discussion about the case design. However as far as I can see there has been no mention about the kind of operating system that it will have and also what kind of in-built application software it might have.

What improvements have been made to the Desktop and GEM(ugh!)?
Does the operating system make use of the DSP for it's own processing (perhaps window management or bitblts?) or will the chip sit unused except for the occasional application designed specifically for the Falcon?

I heard that it will have two O.S.'s. One which is used as on other ST's and another multitasking version called MiNT (Mint is NOW Tos) and then this will have its own multitasking desktop. It was a long time ago that I read this so I may be completely wrong but I would like to be clarified.

Please tell me and other "netters" more about the current software status of the Falcon.

Netters,

I'm posting this for a buddy of mine. If this is the wrong Newsgroup for it, Flame me in E-mail and I'll cancel it (if you tell me where I should post it). He's been bugging me for a while to do this, so here goes:

-=-=-=-=-=-=-=-=-=-=-=- FOR SALE -=-=-=-=-=-=-=-=-=-=-=-

COMPLETE SYSTEM INCLUDING:

HARDWARE

- MEGA ST2 (not STE)
- Monochrome Monitor with Tilt Base
- ATARI PS3000 Colour Monitor (yes that model # is correct. This RARE Atari monitor has a BUILT IN single sided disk drive and looks great on top of the Mega ST2 case.)
- SX212 1200b. modem
- monitor master
- extra-long keyboard extension cable

SOFTWARE

- Spectrum 512, Hyper Link, Band-In-A-Box, TDI Modula-2, GFA Basic 3, STOS, Atari Planetarium

- Grand Prix, Sim City, Captive, Starglider II, Speedball 2, Death Bringer, War in Middle Earth, Powermonger, Gauntlet II (with 4 player adapter)...

- SPECTRE 128 (no roms)

MISC

- Lots of ST magazines and some ST books
- Most Hardware & Software comes with original boxes & manuals

All this and more for $ 750.00 [ed. Canadian funds --LJK]

PRINTER

- STAR NX1000 Rainbow colour 9-pin printer
- printer cable

- 5 NEW colour print ribbons

$ 150.00 [ed. Canadian funds -- LJK]

Can anyone help me...

I have been copying large amounts of data (30 floppies) to a hard disk, some of the data on the floppies was corrupt and the directories created on the atari hard disk are empty, When I try to drag these into the waste bin I get an error message like this:-

An item of the same name exists in this application
or the folder is set to read only.

Basically I cannot remove these empty folders. Anyone know how I can set them to RW on the hard disk and delete them.

No, you won't find Aladin on many archive sites for a good reason: it's a
commercial product, made by some German company. I'm not sure it's still in
production; all I hear about these days is Spectre.

By the way: what about version 1.40 promised for 'very soon' some time ago ?
I began to write a small filter that catches the potential problems with ident size (7 letters) and maps those clashing ids to something else (preferably very close, for ease of reading). As I heard that 1.4 was due very soon, I stopped it, but maybe should I get on it again (first find it)

So what's up with the new version ?
Has our dear Ian given up Atari St ? or Sozobon ?

> best buy.

> Patrick.

I personnally suggest not to choose one language but learn a bunch
of them: it's GREAT FUN and permits you to have a good idea of
programming !

But of course the easiest way is C (sozobon or Gcc)cause it is
widely used and has good debugging tools !

Stefan

PS: the best debuggers are for C, cause it's the language
that needs them at most !

Source record: 216453

The previous discussion about copying from SPARCs floppy drives to Ataris (which I did not follow) probably involved the 'mount' command and involved a discussion concerning the manner in which the disk was formatted.

I've found that the easiest method to copy Sun files onto Atari floppies is to use a program called SoftPC. This program is a DOS emulator available only under the OpenWindows operating system. This is by far the simplest way to transfer the files, provided you have this program. This, unfortunately, may not be the case. I am sorry that I cannot help you with the 'mount' command, but I do not have enough experience in this area. Hopefully another altruistic poster can help you. :)

Do you remember that time when sun could only count up to 3 ?
Yes, it was unix and X and it was powered by a 68020 !

I haven't seen a sun2 (=68010), but I've heard they also come with X.

Of course it's not as fast as a R4000 or HyperSparc or whatever,
but it runs and surprisingly is not that slow !

Don't forget that the speed you feel with X is generally more a
question of responsiveness than of Mips. VM is no good for
responsiveness. That's why less powerful processors can run
X with reasonable speeds (well, the comfort is not excellent,...)
if they don't use too much of VM

Yeah, that's right, but the original poster wanted to go the other
direction. It can be done. I know. My parents send me e-mail all
the time. I *THINK* it's something like

internet: user@system.path

Don't quote me on that though. It's somewhere in the mailer's
documentation, I think. If you can't figure it out, let me know via
e-mail and I'll go poking through our account to find out the
specifics for you.

Hope this helps a little.

I remember seeing a picture of a lcd monitor for the Atari in a picture
from one of the Dusseldorf shows a year or so back. Does anyone know what
happened to it? Was it too expensive to get anywhere.

It's not a 'program', it's a library. This means that you still have to
port your program to Unix, and even for the GEM stuff you have to
do some changes (last time I checked). In addition, you have to pay
for this library, and it's not cheap (corrent me, if I'm wrong).

I'd prefer an X server for MiNT with (a) usage of the full screen and/or
(b) X clients running in GEM windows (this will only be useful with
Winx or MultiTOS, because of the current window limit, and it might be
slow).

>What improvements have been made to the Desktop and GEM(ugh!)?

I've seen a lot of discussion about the new desktop. Saw it in action at the Glendale Fair. It's a definite improvement, but I can't list all the things that have changed. For one, you can assign keyboard equivalents for any menu entry, that was something I really wanted.

>Does the operating system make use of the DSP for it's own processing (perhaps
>window management or bitblts?) or will the chip sit unused except for the
>occasional application designed specifically for the Falcon?

The DSP doesn't have direct access to ST memory (heck, it can only address 192K by itself anyway) so bitblitting is out of the question. A DSP is not a general-purpose processor, so it would be unreasonable to expect it to perform general processing tasks. There are no operating-system functions that I can think of that would benefit from a DSP, so I would expect that only specific applications will use it.
>
>I heard that it will have two O.S.'s. One which is used as on other ST's and
>another multitasking version called MiNT (Mint is NOW Tos) and then this
>will have its own multitasking desktop. It was a long time ago that I read
>this so I may be completely wrong but I would like to be clarified.

The articles I've read say TOS 4.0 in ROM, with the MiNT/MultiTOS added on from disk. Apparently the main difference between Atari's mint.prg and the one we have access to is that Atari's has multitasking AES functions.

JT> create a menu you just put the menu titles and items into an
JT> array of strings and then you do a MENU x$()).

Yes, but GFA itself is an unclean application; it does all sorts of horrible things the programmer has no influence over whatsoever. The bug list of GFA is endless. I could email it to you (it's in German, but your .de address suggests you won't mind. :-)) At least, if they finally got email working on this end.

From the Holy Book of <4epQPni00awA4XBlhF@andrew.cmu.edu>
as spake by osoelgaultier+@CMU.EDU (Stefan Monnier) :

>Excerpts from netnews.comp.sys.atari.st: 7-Oct-92 Re: Which programming
>langu.. Domenico De Vitto@unix.b (454)

>> You can pick up sozobon C at 'a.a' and I've found it pretty good.
>> (go for sozo133i first then when you feel the need upgrade to sozobon2, as
>> the first auto-installs etc)

Actually, no. Despite the misleading version numbers, 1.33i actually is
the more recent version and has a number of bugfixes over 2.0.
Basically, as I understand it, the original authors of Sozobon went off
in another direction, and Ian picked it up. Hence the name change to
Heat-n-Serve C.

>By the way: what about version 1.40 promised for 'very soon' some
>time ago ?

It's stuck in beta at the moment. The last round of bugfixes I know of
was a while back. Probably his free time got munched when school started
[I know mine did :-( ].

My vote's definitely for Fnordadel. First, it's freeware, not shareware. Second, it's got the best damned user manual I've ever seen in a shareware/PD/freeware release. Third, it's been written by a professional who actively supports his users through a custom networked room which anyone using Fnordadel can pick up from a variety of Fnordadel sites, including Round Table (the original home of Fnordadel) and splunge.UUCP (the NeXTstation used to cross-compile the software for the Atari ST). It's also stable on a variety of TOS versions -- to the best of my knowledge, these include TOS 1.0, 1.02(1.2), 1.04(1.4), and 2.05. It also appears to run flawlessly on TTs.

As someone else on the net posted a while ago, Borland doesn't seem to want there to be an English version of the Pure C manual out of pure spite. There certainly isn'y any *economic* reason to deny English-speaking ST users an English manual -- it's not like the product actually competes with Borland's Turbo C on the PC! Frankly, if I ever do buy a PC (yecccchhh!!!), I will certainly remember Borland's churlishness in this regard when considering software purchases.

Bill:

I'd recommend switching to a Supra, as you seem to plan to. It works flawlessly with the Joppa STraight FAX software, and it's a classy chassis, to boot. It's nice being able to FAX stuff around to my office if the gang's in a pinch on any days off I have.

Hiya,

Whats the Big deal about the case design?
that and the 'mushy' keyobard have got to be the 2 lamest gripes!
(welll. in my opinion.. you are entitiled to yours of course..)

I use a 386 and of course have an ST.
Personally, the 386 keyboard is all sticky, and ugh.
the ST's doesn't stick. I don't type 40 pages a day unlike some of you guys/gals

I don't know, but You can _really_ feel a major differnce is keyboards?
I can sorta tell a difference, but it doesn't bother me to the point of
" ARARGH not an ST keyboard! where's my poison!! "

The case design:
does a detachible keyboard and a tower case improve the computer any?
people bitched about the TT's case as being "ugly", Looks fine to me.
why worry about case designs and keyboards?

I would think that if the falcon was just a 030 in a megaSTe case... then you
could bitch about the hardware, nothing new, etc..

I'm holding out for the 040, not because of the case, or keyboard,
but that its going to be reallly fast.

my point is that i have no point.. just voicing my opinions over the bitching.

Timothy Wilson

A little tidbit, I didn't know this before, and I haven't seen this
posted before here.

Multi-TOS is a rewrite of the AES. It of course handles all the multi-tasking
stuff, But, It Does not include the animated icons, new VDI, etc
thats TOS 4.0.

Multi-tos on the TT would probably look just like 3.06,
except the processes go into the DA pull down.

Did every one know this but me?

STraight Fax from Joppa Software Developement is the only one I have seen
although there is supposed to be another (German I think). STraight fax
supports ASCII, IMG, Degas, Calamus, PageStream, GDOS and the ever elusive
FSM-GDOS file formats for sending. It requires as CCITT Group III class 2
compatible faxmodem. I use a Supra and it works very well as does the software
from Joppa. You can reach them at (717) 428-3231 in Dallastown PA USA.

You should be able to get all of these programs on Fidonet. I use
Binkley Term 3.02a with Area Cleaner Software (ACS) and Little Red
Editor (LED) to run as a point on Fido and a node on NeST. I needed
a lot of help from various people to get going. It's difficult to
start with but is well-worth persevering with.

3815. S: Statistics program

Newsgroup: comp.sys.atari.st
Date: 1992-10-10 09:25:00 UTC
From: sacha@aslan.en.open.de
Message-ID: <9210101125@aslan.en.open.de>
Source record: 216433

Hi!

I'm looking for a statistics program for my ST. It should be something
like the SPSS package for *ix or DOS, if it's possible in the public
domain.
Any hint is appreciated.
Please reply by mail.

Are there any good GIF viewers? I have been converting GIFs to SPC format
for quite some time, but would like to be able to view GIF files without
having to convert them first. Any ideas or suggestions would be welcome!
Thanks.

I do think you are making a very big mistake in going into Hisoft Basic 2 it
is not a world standard like GFA and there will be very little support for it,
as for one thing Hisoft don't support there users, and I should know,
I wrote to them about Bugs and Admissions in Hisoft Knife ST, there reply was
get lost we don't wish to know..

Also there was/is more world wide support for GFA than the Hisoft products,
also the speed of GFA has to be seen to be believed, its faster than compiled

>occasional application designed specifically for the Falcon?

I can only speculate on this on the basis of what I saw and heard
at the Atari Messe: The Falcon's OS doesn't seem to make much use
of the DSP itself. However, there are going to be OS function
enabling an application enter a DSP program into a queue, the DSP
will then execute it as soon as it's finished with the other
jobs.
Using the DSP for blitting purposes seems a bit strange to me as
there also is a blitter in the Falcon. Regarding other uses of
the DSP, I assume they can be added by device drivers (cf. the
discussion about a say() call).

>I heard that it will have two O.S.'s. One which is used as on other ST's and
>another multitasking version called MiNT (Mint is NOW Tos) and then this
>will have its own multitasking desktop. It was a long time ago that I read
>this so I may be completely wrong but I would like to be clarified.

Yes, at least at the Messe they said the Falcons were going to be
shipped with a single tasking TOS (4.0?) in ROMs and MulitTOS on
disk. This way, they argued, MTOS could be updated and patched
easier than if it were in ROMs, and users could have the choice
beween single and MultiTOS, allowing them to run application that
crash under MTOS until they can get updated versions of them.
The MTOS desktop will have some changes and extensions for
multitasking purposes of course, but from all I've seem so far,
it didn't seem that different from the TT's TOS.

Yes, that's the spirit! I like it. After all, Atari may have
marketed their machines in an unprofessional way, but the
computers themselves are just great. Therefore, the least thing
Atari and we need is Atari discontinuing the ST-TT-Falcon
computer line and turning around to make boring clones or even
succumb to that Apple hype.

3821. Atari archieve without ftp.

Newsgroup: comp.sys.atari.st
Date: 1992-10-10 13:02:24 UTC
From: ant@mks.com
Message-ID: <1992Oct10.130224.9149@mks.com>
Source record: 216483

How does anyone without ftp access get material from Atari Archieve at
umich? I tried when BART was in use and had no luck with various
mail paths, and bitmail is no longer accepting non-bitnet (or what-ever)
requests.

It is all very nice to see all this neat stuff fly by week after week
but NO ONE BOTHERS TO SEND ANYTHING TO SOURCES and BINARIES groups!!!
You can't assume that everyone has ftp! If you going to upload new
material how about sending a copy to the moderator of comp.sources.atari.st
and comp.binaries.atari.st so that others who are not as fortunate to be
able to ftp everywhere can get some of the new material.

Then Brodie needs to get a grip. Musicians who work with MIDI use the
computer for sequencing because of the graphical interface, ease of editing,
etc -- none of which we need live. Once your sequence has been created and
edited to your satisfaction on a computer, you can dump it to a cheap
hardware sequencer that will suit your needs fine.

In this day and age, when you can buy an Alesis Data Disk for $400 that is
road-worthy and fits in one rack space, there's a scant handful of people
who would rather haul a fragile $1300 computer and monitor to live venues.
A notebook computer, perhaps, but not a full-size machine.

The Falcon does indeed have some nice features for musicians, but the case
design is not one of them. I use computers in my recording studio
(currently Mega 2 ST and Stacy 2, the latter for studio-to-studio work), and
what I seek in a case design is a moveable keyboard and a professional
appearance -- both of which the 1040-style case lacks.

If I end up getting a Falcon/030, I'm going to stick it in a tower case.

>C...??

Yes, but you are forgetting that GFA uses dodgy ways of achieving its
speed - translation: it's dirty, and I have heard rumours that it's
MiNT-hostile. Whereas I have always found HiSoft Basic to be fast, friendly to
use and it has the advantage of having the compiler as an integral feature of
the package, rather than an optional extra. I have GFA 3.5, obtained from a
ST Format coverdisk, but after trying it out for a couple of hours I never
went back to it. Whereas I have used STOS basic (don't laugh) and HiSoft for
over 4 years.

I have never had any trouble with support from HiSoft, as I have never needed
any.

>Whats the Big deal about the case design?
>that and the 'mushy' keyobard have got to be the 2 lamest gripes!
>(welll. in my opinion.. you are entitiled to yours of course..)

The case design is a purely practical thing to me. As I shift about in my chair, I move the keyboard about too, to make the typing as fast and comfortable as possible. If it's attached to the machine, that's hard to do (esp. as the cable on my HD is only about a foot long.)
My other gripe with the STFM is that the keyboard is just too high up. I'm typing this on a Sun type 5 keyboard, and I have it as flat as it will go. That way the desk supports my wrists. When I type on my ST my wrists float in mid-air. Very tiring.

>I don't know, but You can _really_ feel a major differnce is keyboards?
>I can sorta tell a difference, but it doesn't bother me to the point of
>" ARARGH not an ST keyboard! where's my poison!! "

Yes, there is a big difference in keyboards. The standard STFM/E keyboard is no better than a Spectrum in my opinion. When I heard about the kits for making ST keyboards feel better, I bought one as soon as I saw it, and it's a BIG improvement. Instead of 'mush, mush, mush' it's more like 'clunk, clunk, clunk'.

So the case design _and_ keyboard quality are very important to me. I would not wish to buy another machine in the same case as the ST. It might even make the difference between buying a Falcon and a clone.

The way I heard it was that the US branch of Borland didn't want to be
associated with a 'toy machine' like the ST. Fortunately their German branch
were a little more open-minded, which is what led to the existence of
Pure C in the first place.

where's the problem? Connect makes use of GDOS, so just use an appropriate
GDOS font to display 80x24 chars in color. The slightly more expensive way
would be a monochrome display

Thanks Bill, and to several others for your replies. The problem was not simply one of sending email from CIS to the Internet, however, but a (uuencoded) file, probably over 100K in size. I was asked if this was possible by somebody on CIS, who would like to send me a file. I presume the answer is not completely obvious, even to a CompuServe user, since the person who asked the question is a very competent fellow indeed!

As far as I can tell at the moment, the concensus seems to be that it _is_ possible to send a text file, but there may well be limitations on the

allowed size, so a larger file may have to be broken up into pieces. If anybody knows the actual mechanics of how to go about sending a _file_ from CIS to Internet, I'd appreciate hearing about it; then I can pass the info along.

Thanks again to you all for your interest and help.

I've received stuff occasionally via CIS mail. I'm not sure of how you get mail out of Compu$erve to the Internet; the suggestion of sending mail TO a CIS account, and extracting the information made up by the "Reply" option seems to be eminently sensible.

In terms of getting things that might not be text through; you can do that quite nicely by running uuencode on the binary file, and then possibly splitting the resulting file up into pieces. I got my latest edition of Cal 6.3 through CIS in exactly that form.

Don't believe this.

This is probably information based on rumor based on someone who saw a
bootleg copy of an old version of the beta test MultiTOS. There are
some pirate copies of MultiTOS floating around. I've had several people
in fact write to me with concerns based on this MultiTOS. I can't comment
on details, but suffice it to say that everything I've heard indicates
that the bootleg MultiTOS is really out of date. MultiTOS has changed
a lot, and is still changing.

This is correct. I was using the Mac server on a Sun 4 (using SunOS 4.1.1 I think) with no problems. I don't log into the Sun 4 anymore so I don't know how well behaved it is now. I was under the impression the the uw port for the ST is several revisions behind the Mac's so that might be your problem.

Cheers,
Chris

Don't be silly, if there is such an error on the board, it could be fixed
in 5 minutes with simple tools. Sounds more like a typo in the diagram though.

Otherwise it is a perfect third-party opportunity for an adapter unit :-)

> *----=< hierarchical systems are for files, not for humans >=-----*

Who said turning it into a PC company? Maybe you people are not aware of
the fact that Atari used to manufacture clones. If Tramiel really said,
" We'd rather go bankrupt than make boring PC-clones," he must be the
biggest idiot I ever came across. He made boring PC clones, that's why
they discontinued them. They couldn't compete so they decided to run
the other direction and try with the STE/TT/Falcon again. Who is
Tramiel kidding? If he would have made money with the PC, they would
forget the ST completely and move to the PC because that's where the
big money is. It didn't work.....

Jan, no offense but I just read in "Electronics" magazine that germany
has the highest piracy rate in the world. ;-)

I assume that - The Moral von der Geschicht, halbe Eier rollen nicht...

Try GemView, it supports over 20 different image types and will also support TT resolutions or graphics cards (like Crazy Dots, for example), and hopefully Falcon resolutions too. It also runs as a desk accessory and seems to be a well-written program. It's available on atari.archive under the Graphics directory.

3839. ATARI COMPUTER WISH LIST

Newsgroup: comp.sys.atari.st
Date: 1992-10-11 00:40:02 UTC
From: oyakea@warren1b.its.rpi.edu
Message-ID: <gkxzv5n@rpi.edu>
Source record: 216497

******** ATARI COMPUTER WISH LIST **********

As Atari Users, don't you ever see products available for other computers that you wish you could have on your ST. And aren't there things you wish you could do on your ST. Well here's my list of products I would like to see on my ST (please note for any replier I PLAN TO BUY A FALCON);

1) A decent scalable font system compatible with all postscript standards.
2) A decent expansion bus (e.g. VME etc) on more of the ST line besides the TT and Mega STe.
3) A true bi-directional Parallel port.
4) More software releases such as ATM, Pagemaker, CD-Rom software.
(N.B. ATM and Pagemaker are very good packages).
5) At least one University level Math or/and Cad Program such as Mathematica, Maple, Math-Cad, AutoCad, ProEngineer...
6) Upgradeable video route... at least a standard of upgrading an ST's video.
7) At least one 24bit graphics board.
8) At least one 040 accelerator (damn even the A500 has one).
9) At least some C++ compatible compiler.
10) YES!! Multitasking (I use a Sun and can't live without multitasking).
Think of running an application and then needing to list a directory or
have a file print in the background (e.g. text file), or even a comm
program running.
11) More major third party support. Since when did a company like Canon/Lotus
support the ST in any way.
12) BTW!! DOES ATARI USE ST's IN HOUSE ?????
13) MORE ST Magazines or at least some on racks.
14) An ST commercial on MTV.
15) An IBM/Mac emulator from ATARI (well maybe).
16) A UNIX Variant: if a 68010 Sun could run Unix back then, whats the problem?17) A Toaster beater.
18) An Atari Helpline with 1-800 number.
19) Customizable Desktop (have you seen MOTIF ?).
20) Decent CD-Rom packages for the ST.
21) More ST dealers, service people, and software retailers.
22) ST fairs in major Cities like New-York and L.A., why should London have all the fun ??
23) A bigger case for the Falcon030, with VME, two proc.direct slots and CPU module.
24) For Computer biggies a Multiprocessing HUB with the features of the ATW display postcript, and more (this is a wild dream alright !!).
25) Adds for ST games on T.V.
26) A remake of the mega STe (68000),but merged with a 386, with AT slots, this will attack the PC market as well as well as people who need both systems.- I KNOW THIS VERY POSSIBLE.
27) More ATARI communication with users.

28) The major reprimand of ATARI higher ups for any screw-ups.

3840. SM147 : How Good?

Newsgroup: comp.sys.atari.st
Date: 1992-10-11 00:54:44 UTC
From: antony@milton.u.washington.edu
Message-ID: <antony.718764884@milton>
Source record: 216498

It looks like my SM124 high rez monitor may be about to bit the dust and
I'm looking at my options for a replacement.

One possibility is to try and pick up another used SM124. But I've also
been thinking about getting the new SM147. I've only seen these monitors
a few times, and now the local dealers are either out or ...out-of-business.
Is there a general consensus about how good the SM147 is? I like that it's
got a larger display, but I wasn't pleased to see the screen develop interference lines
whenever the disk drive was accessed. Perhaps this monitor was
reviewed in a magazine I could still get my hands on...?

One other option is to get a multi synch monitor. Any recommendations
here? Controls on the front would be important.

THanks in advance for any info on this...

Tony

>got a larger display, but I wasn't pleased to see the screen develop
>interference lines whenever the disk drive was accessed. Perhaps this
>monitor was >reviewed in a magazine I could still get my hands on...?

i am sitting in front of an SM147 as i write this. it sits on a mega4 ST
which sits on a toadfile 130 hard drive which sits on a power director.
next to this "stack" is an SH204 drive. i don't have any interference
problems. i got the 147 for the same reason: my last SM124 went bad. i now
have 2 or 3 of them in boxes. your interference might come from a power
or DMA cable too close to the monitor cable. i am not a EE and only know
enough about RFI to avoid problems (eg if cables must cross each other,
do it at right angles, etc).

visually, the SM147 image is noticably larger than the SM124. you can adjust
the aspect ratio and i have mine set to about 160mm high and about 245mm wide
for a diagonal image of about 290mm. this is about 15% larger than the 124
and it is easier to read when about 2.5 feet from the screen. when i first
got it, it appeared to be somewhat less crisp than the 124 (noted for its
excellent image quality) but now i am totally used to it and its larger
size more than makes up for any perceived softness in image. note that i
don't use the desktop (being in the CLI camp and using the system mostly as
a vt100 with uniterm) so the black text on paperwhite SVGA is good. on the
rare occasion where i display images on the screen, the larger image makes
dots appear slighly farther apart. the quality of images displayed with
my mgif program (which rapidly changes between screens using the so-called
"flicker" technique) are not as good at the same viewing distance. moving
back a foot or two helps. since this represents less than 1% of my use of
the system, it is no big deal for me.

there are controls on the front for power (push button), brightness and
contrast. there are controls on the back for focus, positioning, and aspect
ratio (small knobs which is better than holes for a screwdriver). the cable
on mine is permanently attached to the monitor.

the big problem with the monitor is the lack of any audio capability.
i was considering trying to figure out how to add a small amp/speaker, but
i suppose i'll get a falcon before i get sound for the 147.

some atari dealers will allow you to trade in the SM124 for the SM147.
by trade in i mean they will give a discount on the new monitor.
i bought my 147 at Toad (when i lived in MD) but i kept that SM124 hoping

that someday i could get it (and possibly the others i have) repaired.

I really love MODs!! I have about 20 Megs of 'em and growing! (anyone interested?? I'd like to share).
Now, I like the sound quality of Noise Tracker 1.5. By far it is the best I have heard. I have tried Paula 2.0b with Petra driver. The sound quality was less than desirable, but the speed was perfect. I also tried MPLAY 1.3 but the speed was too slow. NoiseTracker was too fast. I feel like Goldilocks here! Does anyone have the MOD player/editor that is just right? Something with the quality of NoiseTracker but the speed compatibility of Paula. I have only heard of PD/shareware MOD editors/players, are there any commercial ones?
Thanks in adv.

If there was say... a network/information service designed around the
ST, vt-52/IGS interface, A mirror of A.A., multi-player games(for the atari
of course) real time conferences etc...

Who out there would use it...
(like 15 bucks a month or so flat rate)

instaead of sharing the network with otehr interests, it would be just
the biggest group of atarians.
or hoping around to all of the other services.

this is sorta market research...
IOW, don't expect anything :)

posts or email,
wish lists invited.

>nice machine...
There aren't any official statements about the F040. At the moment even the
F030 isn't available (on the CSS show in Collogne this weekend you could see
Falcons but you couldn't buy them). So why spreading rumours about the F040
when even the F030 isn't available?

Date: 1992-10-11 08:24:46 UTC
From: warwick@cs.uq.oz.au
Message-ID: <10591@uqcspe.cs.uq.oz.au>
Source record: 216406

HAEBLER@DMSWWU1A.UNI-MUENSTER.DE writes:

>does someone know where I can find a doc about the GNU assembler
>syntax?

The document "GCC for the Atari ST" by Frank Ridderbusch (available somewhere in the Gnustuff/Tos dir of a.a) has the following information...

Don't use a "." for .l, .w, .b size modifiers. Just omit it.

Below are some examples illustrating all the diferences in EA syntax.

```
MOTOROLA MIT (GAS) C meaning
-------- --------- ---------
#1000 #1000 1000
d0 d0 d0
a0 a0 a0
(a0) a0@ *(a0)
(a0)+ a0@+ *(a0++)
-(a0) a0@- *(--a0)
1000(a0) a0@(1000) *(a0+1000)
100(a0,d0.w) a0@(100,d0:w) *(a0+100+d0)
(a0,d0.w) a0@(d0:w) *(a0+d0)
???? a0@(100,d0:w:4) *(a0+100+d0*4) (68030 only)
???? a0@(100)@(200,d0:w:4) *(*(a0+100)+200+d0*4) (68030 only)
???? a0@(100)@(200) *(*(a0+100)+200) (68030 only)
1000 1000:w *(1000)
```

Literal values are as in C. Eg. $ff00 becomes 0xff00

"|" or "#" masrks comments (but use "|", to avoid confusing preprocessor).

"local labels" can be used:

```
...
bra d5,0f | Branch FORWARDS ('f') to 0
0: | A local label (single digit)
...
dbra d5,0b | Branch BACKWARDS ('b') to 0
```

Pseudos...

```
= As per Motorola "equ"
.text Switch to TEXT segment
.data Switch to DATA segment
.bss Switch to BSS segment
.abort
.align 5 Align to 2^5 byte boundary
```

```
.ascii "foo" String data
.asciz "foo" '\0' terminated
.byte 1,2,3 Byte data
.globl ID1,ID2,... Give ID1, ID2, ... external scope
.int 1,2,3 Integer (4-byte) data
.short 1,2,3 Short (2-byte) data
.space 5,3 Same as .byte 3,3,3,3,3
```

For more details, grab the document from atari.archive.umich.edu. It should be called "gcc.doc", or some such.

```

In article <gkxzv5n@rpi.edu> oyakea@warren1b.its.rpi.edu (Amalaye Oyake) writes:

> 2) A decent expansion bus (e.g. VME etc) on more of the ST line
besides the TT and Mega STe.

MegaST has the MegaBus, and there are lots of cards available for it.

> 4) More software releases such as ATM, Pagemaker, CD-Rom software.
> (N.B. ATM and Pagemaker are very good packages).

Calamus can beat the combination ATM&Pagemaker easily.
There is CD-ROM stuff for Atari too. MetaDOS is available for
connecting&using almost any SCSI CD-ROM.

> 5) At least one University level Math or/and Cad Program such as
Mathematica, Maple, Math-Cad, AutoCad, ProEngineer...

Needs a TT to be efficient enough...

> 6) Upgradeable video route... at least a standard of upgrading an
ST's video.

There is a wide variety of Graphic adapter boards for ST&Mega
available.

> 7) At least one 24bit graphics board.

There are some.

> 8) At least one 040 accelerator (damn even the A500 has one).

coming right up! One German company is about to release one.

> 9) At least some C++ compatible compiler.

Isn't there?

> 10) YES!! Multitasking (I use a Sun and can't live without multitasking).
> Think of running an application and then needing to list a directory or
> have a file print in the background (e.g. text file), or even a comm
> program running.

Fully possible. Just install MiNT or Minix to your ST.

> 11) More major third party support. Since when did a company like Canon/Lotus
> support the ST in any way.

You live in the wrong coutry or you haven't checked overseas yet...
In Germany companies like Kodak have worked together with Atari to
provide a professional full color DTP setups based on TT. And this is

only one example...
All these products are available, you just have to get them overseas,
because there aren't enough markets for such systems to set up a
distributor in the US.

> 12) BTW!! DOES ATARI USE ST's IN HOUSE ?????

Hmm, if we say Ataris, they do. Not just (or at all) STs, but MegaSTs,
MegaSTEs, TTs and some Falcons too. The basic ST is too old...

> 13) MORE ST Magazines or at least some on racks.

Find out about European magazines and subscribe one. If you can read
german, you should try TOS, ST-Magazin or ST-Computer. These are not
for game maniacs or people who have their atari mainly for
recreational purposes, these are for productive and professional
users.

> 14) An ST commercial on MTV.

with Falcon, maybe...

> 15) An IBM/Mac emulator from ATARI (well maybe).

But there are! Spectre GCR makes your Atari to be ewen better Mac than
some real Macs are!
Vortex can provide you 386sx with fast-RAM etc, SuperCharger and Delta
Modul provide you fully compatible AT-slots!

> 16) A UNIX Variant: if a 68010 Sun could run Unix back then, whats
the problem?

There is a Sys V r.4 for TT

> 19) Customizable Desktop (have you seen MOTIF ?).

Well, not like MOTIF, but close. Have you tried Gemini or NeoDesk?

> 21) More ST dealers, service people, and software retailers.

Again, wrong country. Nobody over there has both, that kind of money,
and the idea & faith to market Atari so that it will rise enough.

> 22) ST fairs in major Cities like New-York and L.A., why should
London have all the fun ??

Visit Dusseldorf Germany next year. The biggest Atari fair in the
whole world, dozens of companies, thousands of people and hundreds of
products.

> 23) A bigger case for the Falcon030, with VME, two proc.direct slots and CPU
> module.

Atari is redesigning the case...

> 24) For Computer biggies a Multiprocessing HUB with the features of the ATW
> display postcript, and more (this is a wild dream alright !!).

Falcon 040 with it's multiple DSPs is enough for a lot...

> 25) Adds for ST games on T.V.

Is it worth it?

> 26) A remake of the mega STe (68000),but merged with a 386, with AT slots,
> this will attack the PC market as well as well as people who need both
> systems.- I KNOW THIS VERY POSSIBLE.

A remake of the MegaSTE with better CPU (68030) and SVGA (1024x768
8bit) level display technology. Who needs Intel?

> 27) More ATARI communication with users.

Please explain with examples.

> whats the story?

I honestly don't know what the final version of MultiTOS is going
to look like, and even if I did I wouldn't be able to say.
I do know that MultiTOS is still under development, so nobody outside
of Atari knows for sure what the final version will look like (and
quite possibly nobody inside of Atari knows, either :-))

From what I've heard on GEnie, 4.0 and MultiTOS are not "inseparable";
the single tasking TOS on the Falcon will have the new desktop
enhancements. But I don't have any particular inside information on
this, just what I've read.

> but since you wrote the original, I definately believe you.

Just to clarify: I wrote MiNT, which is a part of MultiTOS. I didn't
have anything to do with the desktop or AES enhancements of MultiTOS,
nor am I presently an employee of Atari (so nothing I say should be
viewed as being in any way "official"!).

Well, I would have to recommend Jukebox; I think it's on a.a. I haven't tried Paula so I can;t compare, however there are a couple of .mods I have that won't play correctly on anything but Jukebox. It's not an editor, just a background desktop accessory. You can do some stuff while it plays in the background, and if you run a program that takes too much processor time it will stop playing rather than slow the tune down.

Yes Spectre fans, I too have had a hard time getting through to Dave Small
I would guess he has,
A; Bugged out and is on hold for a while, not willing to address the public,
B; OR, and most likely, he is really getting to busness and trying to get
out more of his SST boards, and a software upgrade.

Lets hope its B

I have spectre 128, and a MegaTalk Board which I have some interesting
stories about, If you care to start up a diaalog about it I'm willing.
I'd also be willing to buy a used "working" GCR cartridge from someone,
without the rom's, if there is such a person out there.

If you know a Mac harddrive that will actually start up with MegaTalk SCSI
(all do not) in Mac mode, I'd like to know that as well.

Thanks Justin

etlgtme@etlxd20.ericsson.se am Fr, 09.10.92 16:14 in CS.ATARI
e>Can anyone tell me how its done ??

All you need is a working 'tar' for your ST. Format a floppy disk on your ST
and put into the drive of the SPARC-station. Then use the 'tar'-command of
SUN-OS to copy the files to the disk ('tar -cfv /dev/rfd0c *.c' for example, if
rfd0c is the name of the floppy drive).
Finished, you put the disk into your Atari and use 'tar -xv' to extract the
archive from the disk. (You need to have a harddisk and a commandline
interpreter to do it exactly like this).

Greetings,
Ralph

3861. Pandora BBS's lastuser.log file

I know that OSS Personal Pascal, Prospero FORTAN, and Megamax Laser C all allow writing desk accessories. A developer's package is not needed. A normal GEM program can be converted to an accessory with the addition of a couple of calls to (a) set aside memory for the ACC and (b) put the ACC name into the desktop menu. That is the recommended way to develop an ACC; do it as a GEM .PRG first. I have also seen programs that can run as either a standalone .PRG or an .ACC by simply renaming the file; a .PRG must bypass the calls mentioned above.

3864. Help me with my HD backup, I want standard compression...

Newsgroup: comp.sys.atari.st
Date: 1992-10-11 22:25:04 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1687DF4F0.C556212@mizzou1.missouri.edu>
Source record: 216419

I want to back up my hard drive using LHarc, or Zoo or something. All
I have found are programs that do a "special" (non-standard) compression
or programs that don't do compression at all.
Really what I want is a program like (shareware) Multiarc from A.A. except
that it runs in reverse. Is there a shell that will archive multiple
filenames and keep the original program name (except for the extension, of
course)? I could do it by hand, but I want to do my entire 65 Meg HD, which
would suck.....
Thanks in advance...

Jeoff Hines c556212@mizzou1.missouri.edu

Don't compare computers of the current generation with ones out of date.
Once, the 68000 was the most fantastic CPU in the world. Now this is the
Nineties. The development was really fast, so I cannot go and feel high
just because a machine can run X at all. If I think of X on a Linux based
386/33 8 MB PC clone, my eyes get wet from the bare performance of this
equipment. I do not believe that a Falcon 030 could compete with it.

> Don't forget that the speed you feel with X is generally more a
> question of responsiveness than of Mips. VM is no good for
> responsiveness. That's why less powerful processors can run

I still wonder why Atari SysV / Motif on the TT is so many times slower
than X11 on a Sun 3/50.

Regards, Markus.

3866. GNU C++ Game Library - users wanted (need G++)

Newsgroup: comp.sys.atari.st
Date: 1992-10-11 23:33:15 UTC
From: warwick@cs.uq.oz.au
Message-ID: <10597@uqcspe.cs.uq.oz.au>
Source record: 216425

Anyone wanting to try out my C++ game library, please reply, and I'mm
give details for getting it. All sources, and .olb included.

The library is called "AMS" - Atari Machine Specific library. It's not
TOTALLY dedicated to games, but they are usually machine-specific for
efficiency reasons.

AMS includes:

Block Maps (32 pixel, 16 pixel, colour or monochrome)
CrackArt and Degas picture IO
Double Buffering
Sprites (16/32 pixel wide, preshifted/not, colour/monochrome)
Fast Counters (for scores, etc)
Joysticks
Resolutions
Screens
Sound (not sampled sound yet, but coming soon)
Timer

Manual entries included. (not nroff, but in Unix-manual style)

Some very simple examples included.

Sprite generator included ("spr") - generates anti-aliased sprites from
larger Degas/CrackArt originals - such as the rotated planes & tanks in
my Combat game.

So. Contact me if you want to try it out. It is all Free, and protected
by GLPL, so you can modify and/or pass it on. Programs written using the
library will be YOURS, your only obligation is to provide recipients with
linkable objects (eg. in library form) for you code and AMS sources when
you distribute your programs - details can be found in the "man/copying.lib"
file in the distribution. And since AMS sources are a tiny 28K compressed,
that is no hassle at all!

>whatsoever. The bug list of GFA is endless. I could email it to
>you (it's in German, but your .de address suggests you won't
>mind. :-)) At least, if they finally got email working on this
>end.

As a matter of fact, it is perfecty possible to write clean GEM applications in GFA. The editor is not written in GEM (but works ok for the most part anyway), and the interpreter does some nasty tricks, but that doesn't have any consequences on your compiled program. Programs I wrote and compiled with the GFA basic 3.5 system ran on STs, TTs and a Falcon at the Atari Messe right away.
About the horrible number of bugs: I think these are in GFA basic 3.6, which is really flaky indeed. I recently called Richter, the company that is continuing the development of GFA basic, and they told me the load of bugs was mostly introduced by GFA when they introduced support of the TT's FPU. Obviously, the 3.6 system was in a kinda late beta version when the GFA folks got tired of developing it, so they just released it and discontinued their product.
But the good news is: At Richter, they are working on a new version, and according to what I was told, it will have really neat features, such as
* full MultiTOS/MiNT support
* GEM editor
* full support of accessing foreign libaries
* full transparency of data structures
They decided not to waste their time fixing the bugs in the current version, instead they're doing major rewriting of the whole system. The interpreter is expected to become available by the end of this year, and the compiler will be finished later.
They are very interested in input from GFA users at Richter, so

if you have any ideas, suggestions, remarks, bug reports etc,
please send this stuff to Richter. It will help them improve the
new GFA basic.
After my call to Richter I was left with the impression that they
are eager, serious and engaged about developing a new version of
GFA basic, and I think there's good reason to hope that GFA basic
will continue to be an excellent programming language for Atari
computers.

A good language doesn't die just because a company foolishly
decides to discontinue it.

3872. Re: I guess no one knows how to program a desk accessory?

Newsgroup: comp.sys.atari.st
Date: 1992-10-12 04:20:50 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Oct12.042050.16585@actrix.gen.nz>
Source record: 216427

Using GFA-Basic (3.5E) the code for an accessory call is only about 300 bytes! Very simple to do! (Although, setting up of RAM is important, as either you lose it all, or can't use any, which is the most difficult bit, although still simple enough)

It is a VERY BASIC language, and runs a LOT faster than any other BASIC I've seen so far. (And faster than the C-programs I've seen so-far, and more compact code)

Within 2-hours of getting the thing, I'd written my own 'Show free-disk space' Desk-accessory. Quite fun actually!

>called 'ppmtoraw.lzh' (I think, could have been 'pbmtoraw.lzh'), so these
>2 should do the trick...

Exactly. In the Atari version of PBMPLUS there is giftoraw and
pnmscale, and there is a separate file for ppmtoraw. pnmscale is
needed to scale down the size of the pictures (otherwise you end up
with *really* large .raw files).
I've been using these packages to run gifs, jpegs (with DJPEG), and
other images into raw mode for PhotoChrome and the results are usually
at least 2 times better than what can be produced by a good Spectrum
converter (like DMJGIF). And this is just the SuperHAM mode (96
colors per scan line out of 4096) on a standard ST! I'd love to see
what STE PhotoChrome mode (~19k colors from ~32k palette) looks like.

In any case, There are a few things lacking. The slideshow program
provided is really horrible. It only supports drive A: (I believe)
and is severely lacking in features. Even if it was equivalent to the
standard Degas slideshow it would be better. It would be nice to have
a better slideshow program or have something like DSLIDE support PCS
files along with SPC and TNY and PI?.
It would also be nice to have a compressed mode for PCS files. If
you thought Spectrum pics were bad.... PCS pics in SuperHam mode
average about 65k. LH5 compression reduces file size very
significantly.

There are a few bugs in PhotoChrome itself (not compatible with
TOS14FIX.PRG), and it would be nice to read GIFs directly but these
can be worked around for now.
The author is providing the source to the PCSVIEW.PRG (compiles to
3k!), and it would be great to see Lexicor and other companies support
these new modes in rendering and paint software.

Anyway, remember that PhotoChrome is shareware and that if the
author gets enough support, he will be producing some very exciting
software utilizing these new modes. (What is the best way to send
money from the US to the UK anyway?).
This really is the best graphics hack since Spectrum itself.

>Thanks.

If what you want to do is look at a GIF before you convert it, I would suggest using Fastgif.prg (atari.archive /graphics/fastgif.lzh) to look at the GIFs. Fastgif allows you to view the gif within 10 seconds, and the conversion is decent. When I download GIFs I always view them first with Fastgif then convert them with DMJ.
I would suggest actually converting the GIFs if you want to view them again (if you have a vanilla ST/STE without colorboard) because SPCs take up much less room and are quicker to view and better quality than using something like GEMView.
GEMView seems more useful to those with colorboards or TTs or Falcons.

Of Course, the ultimate in ST/STE picture conversions right now is PhotoChrome, but that's a little more work.

The thing that 'jumps' out at me is that two more Atari employees are getting
out.

I'm sure a lot of parallel development has been going on at Atari WRT to the
Falcon line. This _should_ ensure a reasonable release date for the Falcon040
but the release of the Falcon030 now gives them plenty of time to gauge some
changes before then.

I think the Falcon line of computers has the potential to save Atari but only
with proper marketing. Something Atari has not done since the birth of the ST
in 1985.

I sometimes call my SH204 the `vacuum cleaner'... :) And as long as your REAL brain is OK you don't really need more than a 20 Meg Seagate and 500K cache memory.

In Pure-C about 15 minutes, executable smaller than you would believe...:)
Use C - it's clean, fast and compact. Modern basics aren't too bad (I've
used Omikron for years), but C is just more flexible and 'decent'.
And writing an ACC is not at all difficult - just the same as writing a PRG.
I could send you some sample (C-) source if you want to take a look at
'how it's actually done'.

:
: Fully possible. Just install MiNT or Minix to your ST.
Or MultiGEM, or Mag!X (both commercial products, around 200DM I think)

: > 16) A UNIX Variant: if a 68010 Sun could run Unix back then, whats
: the problem?
:
: There is a Sys V r.4 for TT
Besides, MiNT (the freeware version (or was it PD? sorry E.Smith, I keep
forgetting... :-( )) is much more POSIX-ish than most Unix-alike OSs, so it's
usually a matter of minutes to port a Unix program to MiNT/GCC.

: > 23) A bigger case for the Falcon030, with VME, two proc.direct slots and CPU

I could be wrong on this, but isn't Hisoft's Basic supposed to be compatible
with one of the big MSDOS basics?

> as for one thing Hisoft don't support there users, and I should know,
> I wrote to them about Bugs and Admissions in Hisoft Knife ST, there reply was
> get lost we don't wish to know..
With all due respect, this does not sound anything like the Hisoft I've dealt
with. They've always offered great support via Cix (a UK BBS), their own BBS,
and most probably via phone or mail as well, though I've never found the need
to use either (I use the first two). Perhaps it was something in the tone of
your letter?

> Also there was/is more world wide support for GFA than the Hisoft products,
Maybe, maybe not. As I said above, support from Hisoft is good enough for me.
Anyone with Email access can talk to them as well, so people using the net
shouldn't have any trouble.

> also the speed of GFA has to be seen to be believed, its faster than compiled
> C...??
Perhaps if you were using a really bad C compiler, with slow libraries, or
you'd just moved from BASIC to C (ie you're writing in C as though you were
using BASIC), but otherwise that's just laughable.

> Roger..... sheppard_r@kosmos.wcc.govt.nz

Kev, not connected to Hisoft, but a more than satisfied user of Lattice C 5.5
and Devpac 2.

3895. Falcon Refresh Rates

Newsgroup: comp.sys.atari.st
Date: 1992-10-12 12:45:42 UTC
From: reiner@kommu.UUCP
Message-ID: <820@kommu.UUCP>
Source record: 216354

The graphic features of the Falcon have been published and discussed in detail, however, until now I didn't find any indication of the refresh rate of the Falcon.
I didn't buy a TT because of its low refresh rate of 60 Hz (for the normal resolutions), which would have forced me to buy an additional graphics card.

So my question: Which refresh rates can be provided by the Falcon?
Since the SM124 is supported, the Falcon must provide 70 Hz for this resolution. But what about the various other resolutions ?

Hopefully waiting for an answer (and for the Falcon),

Reiner Plaum

3896. Calligrapher: Don't expect any support. (flame)

Newsgroup: comp.sys.atari.st
Date: 1992-10-12 13:55:54 UTC
From: djs@jet.uk
Message-ID: <1992Oct12.135554.29601@jet.uk>
Source record: 216353

Given the ineptitude of the kid attempting to demonstrate Calligrapher when I went to Silica Systems in London, I bought the package largely on the recommendations of advertisements (!) and ST User magazine (just as reliable a source of information as the adverts...).

As it turned out, I was pretty pleased with the package, except for quite a few minor bugs in the PostScript output, and a couple a major ones too (for example, when a letter O was plotted, the inside part was filled in with the same colour as the letter was drawn; a bit like the way scribblers blob letters).

Working Title is the UK distributor, and appears to be a one-man company run by the author of Calligrapher, one Mr N P Johnstone (he's the only person that answers the phones there). After he assured me that there are no bugs in the Postscript driver, I sent him the files to prove that there were. By return I got a letter stating that there were in fact bugs (which I already knew of course), but that most of them would not be fixed. Despite my protestations that these bugs were important, he said that *he* was happy with the output, so that was that. He even told me how another user had made similar complaints, and that he would not be making fixes for him/her either. He then went as far as to suggest, when I pointed out how these bugs showed up in the Calligrapher Gold manual itself, that I was a bad judge of these things just for finding the errors. (I can't quote *exactly* from memory, but it went something like "You've found these errors, and therefore you focus on them, and don't see that other parts of the document don't have errors, and therefore think the errors are important...").

One other major bug is that, where the printer has no built-in font to match that being printed, and Calligrapher has to render the font via PostScript line drawing commands, some coordinates are several pixels out, giving a jerky outline to characters, and an effective resolution of MUCH less than 300dpi. Mr Johnstone said that there was no way he would consider fixing this!

I even ended up disassembling and patching the driver manually to fix some of the incorrect character mappings (eg apostrophes were printed as cents).

Calligrapher is basically almost good enough to recommend, unless you expect any support. (I bought Calligrapher Gold, which is the next step up from Calligrapher Professional. The lack of support and obviousness of a few of the bugs reminds me of a comment made in Sound-on-Sound magazine, where they said that anything with Professional in the name is clearly for amateur use only!).

Anyone wish to comment? How responsive are the US distributors?

Message-ID: <1992Oct12.142946.16710@bnr.ca>
Source record: 216357

Acc's are very easy, believe it or not. Get a program you like to
work as a regular GEM program. Add the capability to accept an AC_OPEN,
and AC_CLOSE message, and NEVER EXIT THE PROGRAM.

AC_OPEN means you can now open your window. Someone selected your
program from the DA menu.
AC_CLOSE means you must now close your window, Something else is
about to run.

These messages are received via the "message pipe"

To review documentation get a developer's kit, the Mark Williams C lexicon,
the Lattice C Users manual, or the Abacus Gem Programmers book.

There _is_ an economic reason.

Adding a new product to your line is not cost free. As well as the cost of
the translation (and the cost of administering the translation), you've got
the cost of printing up manuals, duplicating media etc.

Then you've got to inform everyone in your company about the new product,
and train your support staff. Then there's the cost of maintaining the
compiler, managing updates etc. etc.

I work for a company that writes and sells Ada compilers, and this is the
sort of thing we have to think about before porting the compiler to a new
target machine / OS (even if someone else pays for the port).

Probably because it's running a 4.3BSD derived Unix, and not SysVR4. The
fact that the TT is essentially video-bound doesn't help either.

Am I the only one who has heard of Maple for the ST? Its put out by the
University of Waterloo (or whoever does Maple) and costs quite a bit for the
ST version (I think somewhere between $200 and $500 US funds).

Anyway, I thought someone would have pointed this out by now.

3908. News about F30/F40

Newsgroup: comp.sys.atari.st
Date: 1992-10-12 16:45:15 UTC
From: IFF212@DJUKFA11.BITNET
Message-ID: <92286.174515IFF212@DJUKFA11.BITNET>
Source record: 216358

Hi folks,

a friend visited the computer show in cologne last weekend a talk with some

person of atari germany. He got the information that

The falcon 30 is in the stores,

There is a software product by OVERSCAN (don't know the address) for about DM14
9 ~= US$100 that increases the resolution to about 800x600,

The prototype Falcon 40 exists and WILL have a large case with a lot of slots f
or additional cards.

Are you trying to suggest that if Atari did well making clones that they would drop the ST line of computers? Yes, the Tramiels are businessmen and are concerned with making a profit, but I also believe that they are dedicated to producing INTERESTING, FUN, ENJOYABLE, EASY TO USE, and PRODUCTIVE machines. The antithesis of such a machine is found within the DOS and DOS compatible machine arena. Not only are they slow (Motorola's chips are a MUCH better design than Intel's), hard to use, and have terrible sound, they also force theignorant masses into believing that a PC is the only computer that exists.

Yes, Atari did try to gain some capital by producing the ABC line of DOS clones. They were simply catering to these same computer-ignorant masses. In general, who do you believe to be more knowledgable about computers (in the United States), the average PC clone-user, or the average Atari user?

Please, Mr. Kovarski, don't waste our (actual Atari users) time with your obnoxious, inane, and above all, irritating commentary on Atari. I don't believe I've read one article of yours that had anything positive or useful within its contents. This is a newsgroup dedicated to the USE of Atari machines....not about the PC world or business practices.

I am posting this message to see if I am not alone in my opinions.

> the boring desktop background with a picture, how I can do that ?
> Is it also possible the default font ?
>
> Thanks in advance.
> Savino.

Yes, you can replace the destop with a picture. The picture you use must be Degas, Degas Elite, or NeoChrome format. All three resolutions of Degas are supported. Load the picture(s) of your choice into the NeoDesk folder and rename it to NEOPIC_L.PI1,PC1,OR NEO as extender for low rez pics, NEOPIC_M.PI2,OR PC2 for medium rez or NEOPIC_H.PI3 OR PC3 for hi-rez pics. Of course the picture to be loaded must match the screen resolution that NeoDesk is about to load into. You can have all three pics in the folder if you use all three resolutions: NeoDesk will examine the files and load it in the correct format.

Note however, that the Desktop picture will use 32K when at the NeoDesk desktop, but will unload when running a program. You must have the "Unload for Execute" option set to "Yes" for this to work.

As far as the font loader utility, if I understood your question correctly, you can place a copy of FONTLOAD.PRG from the fonts folder of the extras disk into the AUTO folder. Place the NEODESK.FNT file into the root directory of the boot drive, the Neodesk3 folder, or the Auto folder itself. Fontload will look at those three places to load it from. If neodesk.fnt file is not found, the system font will be used.

Hope this helps... from one very happy NeoDesk user to another!
Cheers!

In article <820@kommu.UUCP> reiner@kommu.UUCP (Hr Reiner Plaum) writes:
>The graphic features of the Falcon have been published and discussed in
>detail, however, until now I didn't find any indication of the refresh
>rate of the Falcon.

I believe it is 72 Hz. This has been mentioned a couple times -- so this
should be enough for your ST monochrome (which BTW can be done on an
Atari _color_ monitor now too!) as well as hi-res modes and other stuff.

>I didn't buy a TT because of its low refresh rate of 60 Hz (for the normal
>resolutions), which would have forced me to buy an additional graphics card.

What's wrong with 60 Hz? All TVs in the U.S. use this (as do all STs
currently). Does this detract from the picture quality? And the UK
seems to get along just fine on 50 Hz.

>
>So my question: Which refresh rates can be provided by the Falcon?
>Since the SM124 is supported, the Falcon must provide 70 Hz for this
>resolution. But what about the various other resolutions ?
>
>Hopefully waiting for an answer (and for the Falcon),
>
>Reiner Plaum

Ben Gilbert
bgilbert@cs.washington.edu

P.S. - I'm no expert on video modes and monitor display techniques,
but doesn't the TT also have to have 70 Hz to support the Atari
monochrome? Or does it only have the VGA monitor connection? Is
the refresh rate defined by the video mode and the power frequency
or can it vary depending on the computer alone?

3914. Warp 9 updates sent to a.a.

Newsgroup: comp.sys.atari.st
Date: 1992-10-12 20:30:56 UTC
From: ekrimen@wet.UUCP
Message-ID: <4357@wet.UUCP>
Source record: 216371

From Juxtaposer (I think baffoni@aludra.usc.edu)

Hi all,

I just uploaded three files to A.A. that will update Warp9 versions
3.70, 3.71, 3.72 -> 3.73.

The files are in atari/New, and are appropriately called:
"w9371upd.lzh" 3.70 -> 3.71
"w9372upd.lzh" 3.71 -> 3.72
"w9373upd.lzh" 3.72 -> 3.73

The updates fix a couple of bugs (Gee, go figure), but they do NOT
work on versions previous to 3.70 (if you have Extend-O-Save, you can use
'em).

-Mike

=-=-=-=-=-=

A little addendum from moi:

For those of you who don't know, Extend-O-Save is the new feature of the
CodeHead's Warp 9. It's like After Dark on the Mac and Windows in that
it enables the user to load different screen saver modules. The
documentation for the modules is freely distributable. The upgrade from
3.6x to 3.73 must be obtained directly from CodeHead (or European
distributor I suppose, if there is one) and costs $15.

To put it simply, the screen saver is great!

>
>They have always made and still are making boring PC-clones aren't they?
>

They did make PC clones. The PC1, PC2, PC3 (8086 machines), PC4 (80286),
PC5 (80386), ABC 286/8, ABC 286/16, ABC 386SX and a few other variations.
Amost all of these machines are CRAP! After this Atari did as many other
companies; used Taiwan vendors to produce a clone with the Atari name on it.
These were the ABC 386SX II and the ABC 386 DX II. (These were of much better
quality than the old ones)!

Early 1992 all PC production and sale/support ceased!!!

From: leonp@cs.kun.nl
Message-ID: <Bw14Ds.Ly5@sci.kun.nl>
Source record: 216374

Hello folks,
I'm looking for a simple program to browse through and read my mail.
I download my mail from our universities unix machine(s) and I want to be
able to read it on my atari. Just reading it in an editor or normal
file browser is not enough because:
a) You dont have nicely formatted headres
b) On the unix system I use mh that produces numbered files in mail format
so I need a list with subjects before I can choose what file to read.

Does anybody know if there is such a program available for atari?

Thnx,

What's the matter with CoNNectAnsi? Personally, I think it's one of the nicest small fonts anyones done. Lots of white space between the lines, unlike the system 8x8 font. Are you runnning in colour. I noticed that it's a bit big in medium rez. There I used the IBM gdos font that comes with STalker. I don't know if that's in the STalker demo package, and as I've lost e-mail contact with Eric R, I don't know how he'd feel about me uploading it to a.a.

So Eric, if you're reading this, please send me mail with a new address to contact you, as I have a few bug report/suggetion for STalker 3.02.

>There _is_ an economic reason.
>Adding a new product to your line is not cost free. As well as the cost of
>the translation (and the cost of administering the translation), you've got
>the cost of printing up manuals, duplicating media etc.

>Then you've got to inform everyone in your company about the new product,
>and train your support staff. Then there's the cost of maintaining the
>compiler, managing updates etc. etc.

But yopu've completely missed the point here. Pure C is _not_ a
Borland product anymore. They sold the rights to Application Systems
Heidelberg, and except for a few header files, there is no longer any
reference to Borland or Turbo C anywhere in the product. Thus, Borland
is not in any way obligated to support the product or inform their
employees about anything.
Personally, I'd be more likely to guess that ASH doesn't have
any interest in translating the manuals and help files anyway, given
that the with the current market in English speaking countries, it is
unlikely that they'd break even on the cost of translation, and printing
manuals. It would be nice if they could translate the online help system
though, and as someone has stated it's incompatable with Borland's PC
help file format, it's unlikely Borland would have much clain on it.
Also, as 80% of the info in the help system is from Atari's
documentation, I can't see how the original writers could claim anyting
but a compilation copywrite.

> What's happening with support of GFA on other platforms? That's the
>main reason I still use GFA for some projects - it's easier to port to
>PCs when using a graphics interface than rewriting a C program...

The best way to get definite answers to this question certainly
is asking GFA (whose address I don't have handy) and

H. Richter Distributor
Hagener Strasse 65
W-5820 Gevelsberg
Germany

Phone: +49-2332-27-06
Fax: +49-2332-27-03

GFA has not discontinued GFA basic in general, they just
discontinued it on the ST. At the CeBIT this year I talked to the
GFA people at their stand, and I was left with the impression
that they are focussing their efforts on the PC market.
Therefore, I'd be quite confident that they will continue to
support GFA basic on PCs. But I never checked out GFA for the PC,
so I don't really know.
The compatibiltiy between the PC and the Atari versions may be
another question though, now that they are in the hands of
different companies. It would certainly make sense if they could
agree on some sort of standard core of GFA basic that will be
supported on all platforms, but I never heard of such plans.
Maybe it's too early to think about such things, and then, it may
become increasingly difficult to support a load of convenient
functions under OS's that are developed separately from each
other.

Nobody knows for sure why it is the way it is. -)
The Pure C distributer in North America wanted to create some text files
that were Atari specific. They recommended to get any Turbo-C (PC)
book, along with those files you should be able to start developing. There
are about a 1,000,000 english books about Turbo-C for the PC. There is
one developer who did exactly that, namely BitBlit Systems with their
Turbo Board BBS. Bill Miller, the programmer of the program, is using Pure
C and as far as I know he doesn't speak german. Personally I haven't
seen any text files so I don't know what is going on there....

I know though that Borland C++ beta is out for OS/2. ;-)

Hi!

I have programmed a litlle bootsector-prg to do the job (some years ago).
You only have to put the boot-floppy (with the B-boot prg) in drive A...
The trick is very simple. Set "_bootdev" (word at $446) to 1 and reboot.
If you really need this prg, drop me a note (if there are several I will
uplaod it to a.a)

Bye,
Wolfgang.

You can read all you want about the Atari Falcon and it's specs and uses etc..
on two very nice BBS systems.

I run one and my friend runs the other.

CYBERNET 1 and 2 both have Falcon Discussion Rooms.

CYBERNET 1 (510)635-9509 Sysop "*DEATH*"
CYBERNET 2 (510)834-1707 Sysop "ST MASTER" (that's me bythe way)

Call either or Both, although I would like you to call CN2 because I specialize
in software development and I'm starting an Atari Falcon Software Developer's
group.

Hi!
I'm novice in RELCOM. The first problem I met on this way was
that I can't run uupc.bat or uuio.exe on my ATARI 1040ST. I
use PC_SPEED v1.5. That's good, but many communication programs
as well as uuio.exe can't normaly find COM1 and halts. Can
anybody help me to solve this problem? Or maybe I should get
TOS communication program to use RELCOM? Thank You.
Algirdas.

>concerned with making a profit, but I also believe that they are dedicated t
>producing INTERESTING, FUN, ENJOYABLE, EASY TO USE, and PRODUCTIVE machines.

Nice to see that Pollyanna is alive and well..

Jack Tramiel has been quoted as saying:

"I'm not in business to make computers, I'm in business to
make money."

If he can make more money producing boring PC clones, you
better believe he'll cut loose every ST owner and leave them
twisting slowly in the wind..

>Yes, Atari did try to gain some capital by producing the ABC line of DOS
>clones. They were simply catering to these same computer-ignorant masses.

Glad to see you can tell us with such assurance just what's
inside those Tramiel minds.. did you know they've had PC clones
since 1987, long before the "ABC" name was invented..? Did you
know they were ready to jump onto the money wagon with both
feet ever since the Atari PC1..?

>Please, Mr. Kovarski, don't waste our (actual Atari users) time with your
>obnoxious, inane, and above all, irritating commentary on Atari.

That's right.. don't confuse us with the facts...

According to Jack Tramiel, "Business is War".. and unfortunately
we're the enemy..

3934. Re: Sending file from CIS -> InterNet

Newsgroup: comp.sys.atari.st
Date: 1992-10-13 07:28:47 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <67632@cup.portal.com>
Source record: 216391

Sending mail from CompuServe to Internet is indeed possible..

I don't have the exact syntax for the addressing here with me, but
it's extremely simple..

The very best way to get the precise format is to go into CIS Mail
and type HELP INTERNET

The form of the address is something like: >INTERNET:dufus@funnyvale.com

Unfortunately, sending mail from Internet, and analyzing the return
address will NOT work..

UUEncoded binary files should work fine.. I'm not sure what the maximum
file size is, but breaking a file into several segments shouldn't be
much of a problem..

>currently). Does this detract from the picture quality? And the UK
>seems to get along just fine on 50 Hz.

Let's say 60Hz is just all right and 50 is not. After all expensive TVs use a double scan mechanism to get 100/120Hz refresh rates. You can easily see the difference if you focus on something (or somewhere) slightly above your monitor. You will see that it flickers a lot. (But that's already a lot better on 60Hz.)

Does the TT have 60Hz for all its built-in resolutions? I'd like to know because I recently got the idea of buying a TT just after the Falcon gets introduced (there must be some pretty cheap +-1 year old TTs on the market by then!). After all MultiTOS will run a lot better on a TT with loads of fast RAM than on that `stupid' MultiMedia games machine.

ORDINARY? So what do YOU want, just one of those ugly grey boxes they
put PCs in? I think the TT looks very nice; you can see at first
glance that you're not dealing with just-another-PC-clone here. I'd be
perfectly satisfied with a Falcon in a TT-case.

Ferrari-red of course.

(Unless of course, they'd put it in an Iris Indigo-case. Now THAT's a
nice box.)

The first 030 machines arrive Germany this week, but it is only about 200.
As for England they will have about 2000 machines before christmas, and
Germay some more, but there will be no mass sale until early '93.

It is not a "hurry" to get the machine inn mass before xmas since no
software is released yet. It is for Atari's best that they have some
software ready when the machine finally hits the market. And hopefully it
will be shipped with MultiTOS!!!!!!!

Roger A. Wahlgren

>Perhaps if you were using a really bad C compiler, with slow libraries, or
>you'd just moved from BASIC to C (ie you're writing in C as though you were
>using BASIC), but otherwise that's just laughable.

Well, it may not be that ridiculous after all. I've found out
that a very significant amount of time is actually spent not
executing interpreter stuff, but TOS calls. Seems to me that even
the best C compiler can't shorten the execution time of TOS
calls...
Also, there's no reason why compiled C should be the fastest HLL.
Much rather, it's mostly a question how well the compiler and the
libraries are done. I agree that modern C compilers have an edge
over GFA basic these days, but that may change when the new GFA
version by Richter hits the street. BTW, according to Richter the
new GFA basic will allow full access to any library, so you'll be
free to choose the one you think is the best.
Finally, the claim that a "C-ish" programming style automatically
will compile to fast programs is considered to be folklore even
by most C folks, including those who maintain FAQ sheets and
such...

Sacha:

You might want to try a program called BSTAT (latest public version is 2.43). It's not SPSSx or SAS, but it's still quite an impressive effort, and it's shareware. Does some very advanced statistics, and has a built-in "coaching" feature. When you send in your shareware fee, you get back a 120+ pages manual with a great deal of tutorials on stats. Good graphing/charting options, too. I have no idea if it's available on any of the servers, but it's definitely available on both GEnie and CompuServe, if you happen to have access to either of those commercial online services. Give it a try. The .LZH archive is about 230K in size, so D/Ling it from those commercial services will run you $5-6 Canadian. Good luck.

3948. Mint versus Powerdos

Newsgroup: comp.sys.atari.st
Date: 1992-10-13 12:44:56 UTC
From: SPAC000 <SPAC@UNB.CA>
Message-ID: <13OCT92.09448939.0176@UNBVM1.CSD.UNB.CA>
Source record: 216319

What is the current status of MINT? Will it allow multi-tasking or task-switching of ordinary (legal) GEM programs like WordPerfect and Flash II? The version I tried a few years back was not really functional, but I've heard it's been much improved since then. And what of PowerDos (I hope I have the name right--I mean the OS patch from Dragonware)? Willit at least let you task-switch with ordinary programs? And what about easy set up directions for MINT, which is wee bit tricky--is there something of that nature in the MINT folder on atari.archive.umich.edu? I just downloaded some PI3 images of what seemed to be MINT (it may have been Multitos, but there is a little overlap there) and it revived my interest!

3949. Re: Programming Language

Date: 1992-10-13 12:45:58 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Oct13.124558.21629@crc.ac.uk>
Source record: 216311

OK, I have narrowed down my choice of language to learn to either:-
Hisoft Basic 2
or
GFA Basic v3.5

I thought that Hisoft was one of the "best" producers for serious stuff (like Microprose for sims) and did give good support.

Some people disagree with this.

So, which would you suggest?

A few requirements:-
1. Cheap as possible (GFA in front there, but don't you get other stuff in the Hisoft pack which are extra for GFA?)
2. Falcon compatible (Hisoft is, don't know about GFA. I want to use the program on a ST or Falcon but not *necessarily* to use the programs I make on both.)
3. Easy to learn (I am a complete beginner and wouldn't know where to start!)
4. Preferably able to run from 1 floppy. (I haven't got a hard drive yet, I'll probably get one with the Falcon *when* I can buy one!)

Thanks *very* much for the help, I'd be well and truly f*cked without your help!!! (I would have to go by what they say in adverts! Not a good idea :-))

Another rumor I recently heard holds that Borland may have done
HiSoft a favor. I was told that HiSoft offered Turbo C owners
in the US a "swapgrade" to Lattice C, and maybe they asked
Borland to do something to keep them clear of competition with
Pure C in the US.

>same as learning BASIC, Pascal, or COBOL...is it?
>

If you try to learn assembler with no previous programming knowledge, the task is daunting and you are likely to end up being able to write programs, but not very well. (Risk of starting flame war). My rationale is that while just about anyone can write programs, it takes skill to write a good program. Good programs are much more than speed or size although in a few instances these can be important. The critical issue is maintainability. Yes I know, "you want to knock up this quick routine to .... and you'll never touch it again'' until you need to modify it 1/2/... years later and find you cannot remember what this bit of coding does. The keys to maintainability are structure and documentation which can be learnt from a high level language.

OK so what does this have to do with your question? I would recommend your first step is to learn a structured high level language (HLL). Pascal is a good bet as it is rigid and will not let you get away with much. Basic is a possibility but it must be a good implementation which enforces structure {any recommendations ?} as I've seen many an unstructured ``rats nest'' thats worse than assembler to read. C is not a contender. If you are forced to use C, then you really should use strict_ansi to get the right level of checking but even then its too easy to write poor code.

With your HLL under your belt, you can now learn assembler (or C for that matter). Start by building the assembler equivalent of your HLL statements. In fact this is a good way to program in assembler anyway as you can use the HLL statements as comments to your assember, augmenting the textual statements. In no time you will become familiar with the best ways of implementing your code and will be ready to use the memory/time saving techniques but being aware of the above, you will know how to document them and so be able to understand them next time you look at the program.

If you're stuck for understanding the translations from HLL to m/c code, try looking at the object file to see how the compiler did it. If you're working with C by now, you can use the -S flag and look at the asm output.

Finally, if you want to go the whole hog, learn a structured design method :-)

>to the Falcon..

>The people there were surprised to find out that "PIM" is generally
>understood to mean "Personal Information Manager", referring to small
>electronic notebooks like the Wizard and Portfolio..

>They thought they'd invented it..

>BobR

That goes to show you how out of touch they are. When I said that the
Falcon was going to be refered to as a PIM, just about everyone said,
"Personal Information Manager? I thought you said it was a multimedia
machine?" They have to quit firing or forcing people out of that
company, or if they do, replace them with people that are knowledgable
and not just cheap to hire.

I don't know what their marketing staff is like right now, but if its
like their OS development team, I feel sorry for them. With Allan P.
and Ken B. gone, poor John Townsend is left all by himself to manage
the XBIOS development.

Also, did you hear that the Falon development team was offered Atari
stock as a bonus for finishing the Falcon? Yeah, they refused it.

Message-ID: <2627@devnull.mpd.tandem.com>
Source record: 216327

I don't even know what UUCP is, and here I am asking how to get it. I do understand that UUCP is required for me to be able to transfer files between my Atari ST and a friend's Unix system, though, so this is my first step.

Is there something which runs on a 1 MB ST (no MiNT, no Minix) that allows me to establish a UUCP connection over 2400 baud modems with a Unix (actually Xenix) machine? I figure if it's not known on this newsqroup, it probably doesn't exist.

> can easily see the difference if you focus on something (or
> somewhere) slightly above your monitor. You will see that it
> flickers a lot. (But that's already a lot better on 60Hz.)

wrong. TVs operate at 60Hz period. what makes them flicker is that
they're interlaced to effectively double the vertical resolution.
a -full- frame is only drawn on a TV every 30th of a second. half
frames (even/odd scan lines) are drawn at 60Hz. scan doublers
-also- work at 60Hz, but buffer the previous half frame and draw
the whole thing in one 1/60 second sweep instead of 2. this is
also the method 'flicker-fixers' on the Amiga use.

if you look at an Amiga's different graphics modes you can see the
difference between 60Hz interlaced and 60Hz non-interlaced. flicker
only becomes barely noticable in non-interlace at around 50Hz, which
is PAL standard. if i remember correctly, flourescent lights also
operate at 60Hz without noticable flicker. it isn't until they get
old and start 'misfiring' that you notice the flicker.

>Fully possible. Just install MiNT or Minix to your ST.

MiNT's just fine, if you want to run multiple TOS or TTP programs concurrently.
What we want is something that'll do the same for GEM and TOS together.
MultiTOS may (*may*) take care of this...

>
>> 11) More major third party support. Since when did a company like Canon/Lotus

No, we live in the right country. We want more major third party support *in
america!*

>
>> 12) BTW!! DOES ATARI USE ST's IN HOUSE ?????
>
>Hmm, if we say Ataris, they do. Not just (or at all) STs, but MegaSTs,
>MegaSTEs, TTs and some Falcons too. The basic ST is too old...

I wouldn't be so sure. Last I heard, all of Atari's operation are done on
PC/compatibles. But they may be using Atari PC-clones, so in a loose sense, they
may be using Atari's in-house.

Although I did hear that they switched their UNIX box to a TT running ASV...

Multiple DSP's would be nice (still just a rumor, however) but they're not going
to be able to do the same kind of thing that multiple CPU's could do...

>
>> 25) Adds for ST games on T.V.
>
>Is it worth it?

Not now. Maybe a couple of years ago, though. What Atari needs to do now is get
the Jaguar on the market and advertise it. How about this... You're watching MTV
again... Black screen, voiceover says "Now, the first name in video games,
becomes the last word in home video game systems"... Then a nice computer
generated sequence of a Jaguar, (the cat) (maybe done on a Falcon030) shown
running through a jungle (and maybe hunting down and slaughtering a certain
Italian Plumber and Blue Hedgehog)... Voiceover again, "The Atari Jaguar.
We've let the Cat out of the bag."

>
>> 26) A remake of the mega STe (68000),but merged with a 386, with AT slots,

Your last two addresses were correct. For instance, if you wanted to try to contact me on GEnie, you would address it to me as O.CONTRERAS1.@GENIE.GEIS.COM. There's a catch to this though. Your friends need to pay an extra $10 or so to receive Internet mail. That's probably why your messages bounce back. I don't subscribe to it. I don't need it.

>your letter?

I've also had good support from HiSoft, when I can reach them, in
terms of clarifications on things not well documented, or, in the case
where I bought the update to Devpac 2.25 and found some new commands by
accident, and wondered what they did, they were quite helpful in
explaining them.
However, where I've found them not all that responsive, is in update
suggestions. When I was on GEnie, they were telling people who were
tired of the lack of support for Madmac, that they should move to
Devpac. When it was pointed out that Devpac lacked some features that
were hard to give up, they said they'd happily incorporate the features
into Devpac. However, whenever anyone mentioned a feature, all they got
back was an explanation that it was impossible to put into Devpac. As a
devoted Devpac user, I also got a bit tired of waiting for the Devpac 3
update, which definately took a back seat to the Lattice 5 development.
Now that it has come out, the upgrade is more expensive than the original
Devpac 2 cost when new. Not exactly a reward for patience.
I like Devpac 2 a lot, and would have liked to stay with HiSoft,
but when the original author left HiSoft a while back, I think they
had problems getting anyone who could take over the package and improve
on it. They already had a 4 window editor as part of their Lattice
package, which was obviously based on the Devpac editor. It would seem,
from my perspective, that an less expensive upgrade to a multi windowing
devpac 2 should have been out years ago.
On a similar note, I remember a friend looking at their basic
package when it came out, and deciding to wait for the debugger they
promised for it. Does anyone know if they ever shipped one. I have the
same feeling about Lattice 5. I would buy it tomorrow, if it had a
source debugger, but their track record on followup products is pretty
dismal. All you here when asking about the source debugger, is HiSoft
saying they're still working on it, and 4 or 5 people saying they get
along fine without it and who needs one anyway. Well I do, which is why
I bought Pure C instead. I found the debugger helped me learn C much
more quickly than times when I've tried with other packages.
Like Atari, HiSoft is a company I want to support, but they seem to
keep making it hard to do so.

Has anyone read any details of the new keyboard chip that's supposed to be in the Falcon? Is it just a faster version of the one in the ST keyboard?(That'd be my guess, as it would be most compatable).

>This was mentioned about a week ago. Apparently the answer (for this specific
>case) is: S.PRICE19@genie.geis.com.

It should also be mentioned, if it wasn't before, that this only
works if the GEnie user has signed up for the Internet mail option. From
what I've heard, this is expensive enough that few users are doing so.
There was a discussion on another newsgroup about this a while ago,
and people were speculating as to how long it would take for GEnie to
shut it down if users started using it to access mail servers on the
internet. From what I remember, the cost would be out of line, unless
you were to use it for getting uuencoded binaries, or subscribed to a
lot of mailing lists.

|> ween my Atari ST and a friend's Unix system, though, so this is my first
|> step.

Actually, you don't need UUCP; that's simply one option. You can also various 'binary' file transfer protocols such as XMODEM, Kermit, etc.

UUCP can be convenient, as the file 'copy' operation is done in the background on the Unix host, and can be automated. However, I have access to Unix host which has both XMODEM and Kermit; I have obtained many ST programs from the atari.archive by (1) ftp to local Unix host, (2) XMODEM download to ST. I don't recommend UUCP (Unix-to-Unix CoPy) unless you have NO other alternative, and I am doubtful if there is an ST version of this somewhat complex Unix software suite.

P.S. If you just want text transfer, all you need is a terminal prog with text-capture (to file) feature.

> C...??

> Roger..... sheppard_r@kosmos.wcc.govt.nz

As far as I've seen, GfA basic is faster than C only when dealing with
floating point numbers (quite usual in Basic, much less in C).
The difference seems to be due to the fact that GfA uses a special
floating point representation, very well adapted to the 68000, instead
of the standard IEEE one.

As soon as you don't use floats, the C is faster (even much faster sometimes)

But it's true: GfA basic is just amazingly fast !

Source record: 216336

About a week ago I was mindlessly rambling along about the buswidth
and video bandwidth of the Falcon. Well, I just got hold again of an
old C't' issue and it sez: Max video pixelfrq == 32 Mhz on the Falcon.
If you figure that a pixel is max. 2 byte in the Falcon that would
be 'ta da' 64MB/s (as predicted). But on the other hand so what ? This
could be all wrong too.

On a more interesting note, the article also sez that you can feed the
video chip an external signal to double or even quadruble the pixel
frequency, the internal hardware normally provides.
Which means that you can easily get higher resolution.

Well it seems that this has already been done. Something called the
Screen Blaster does:

880x608/61 Hz,
768x496/72 Hz
640x480/80 Hz

I assume that these are 8bit modes (but this part is totally rumor, it
could be mono, or even truecolor, I am just guessing). The prize is said
to be 149.- DM and the supplier is OverScan. (nope no affiliation with these
dudes) And said to be available NOW.

I have no idea, what monitor you need for that.

Nat!

There's an utility included in the cs-TeX package called "gem_util.prg" which
is capable of .gem -> .img conversion, including some header manipulations.

You can find it on a.a. or on ftp.uni-stuttgart.de (129.69.1.12), located at
/soft/tex/machines/atari/cstex/ .. /bilder.lzh
(don't know the correct pathname by hard).

>Some people disagree with this.

>So, which would you suggest?

Maybe you shouldn't make too big a problem of the choice. GFA is decent, as is probably HiSoft... I've programmed for 3 years in Omicron basic (which is not always too decent :) and I had loads of fun, learned lots of programming tricks, learned all about GEM, VDI and AES, etc. I've written GEM-applications of which I'm sure noone can tell they're written in basic, etc., etc.
IMO (and I'm sure I'm not the only one), there will come a day when you want something stronger than basic and you'll switch to (e.g.) C (like I did :). In the meantime just make sure the basic you buy does what you want it to be able to do (e.g. run on a Falcon) and don't worry too much about all the pro's and con's. It's largely a matter of taste - GFA-freaks will tell you never to buy HiSoft and the other way around. There can hardly be any 'truth' as to what the 'best' language is. Buy a good one (and there hardly are bad ones nowadays), stick with it for a few years, learn how to program, learn the ST (GEM et. al.) and then (after a few *years*) decide what you *really* want from a programming language. By then you'll have enough experience to know what you want and to know where to look for it.
And maybe you'll discover that the language you have does exactly what you want - so you stick with it for another couple of years - or maybe the rest of your life :).

GFA/ST was picked up by another company who is doing a total re-write in order to 'fix' the 'quick fixes' GFA put in when they updated it over the various years.

GFA/DOS and GFA/Windows remains the property of GFA, and they are working on fixing the current bugs in that version. I'm not sure what the status of the complier is though.

GFA/Amiga status is unknown.

Um, I am unfamiliar with the term you are using. What do you mean by
"video-bound". Are you referring to the fact that the video must steal cycles
from the CPU to refresh the screen, or is this something else. If so, remember
that only STram is affected by the video hardware - the TT can just blaze away
in TTram (or FastRAM for those who read the documentation).

BTW, I thought that ASV was supposed to be a true SysVR4, not a berkley
derivative. Where'd ya get that info (about being a 4.3BSD derivative)?

From: mbaffoni@skat.usc.edu
Message-ID: <1bfrtlINN9ah@skat.usc.edu>
Source record: 216342

In article <BvvvzM.CyK@iat.holonet.net> wilsont@orac.holonet.net (Timothy Wilson) writes:
>Hiya,
>
>Whats the Big deal about the case design?
>that and the 'mushy' keyobard have got to be the 2 lamest gripes!
>(welll. in my opinion.. you are entitiled to yours of course..)

Big Deal:

(1040)STE case: TT case: IBM case:

1 internal floppy 1 internal floppy ~5 drive bays

1 small power supply 1 medium PS 1 large PS

1 2.5" HD, LPS design 1 3.5" HD, LPS NOT see drive bays
(present max=~80MB necessary (max ~1GB) (max n/a, but
can be > 2GB)
1 built in keyboard, ext 1 detachable keyboard, 1 detachable kb
will be available from but no available replcmnts replacements
3rd parties. so far(that I know of) for IBM availb.

1 expansion slot (only Falcon, 1 expansion slot (VME, not many (typ:~8)
the PDS slot)* counting ST/TTram connectors)

*note: there is a memory card slot as well, but limited space also limits the
amount of memory you can put in (and design of motherboard follows - max 14MB)

By using a STE or TT case, atari is effectively limiting the expand-
ability of the system. Both in terms of PS, device bays, and most importantly
expansion slots. A curse of owning a TT has been deciding between graphics OR
connectivity (ie, ethernet), however this has not been much of an option due
to the old catch22 (few buy ethernet products as they are expensive/hard to
get, and producers make few/expensive ethernet products because the demand is
low). If the new machines were in cases that permitted more than one VME
(or other standard) expansion slot, those who have wanted ethernet but needed
the graphics can be added to the pool of potential ethernet customers, as well
as those who chose ethernet, but want to add graphic cards. Not to mention
that by adding device bays, you reduce the need for external HDs, thus reducing
the system to nearly a "one unit on stage" system that atari was trying to
target with the Falcon. When you add devices internally, you are adding to
your power load so it helps to have the option of adding really hefty Power
Supplies (say a 330Watt PS to handle the 2GB drive, the CD-ROM, the optical
drive, and oh yeah, the '040 system board with 32MB of RAM). Of course,
since an IBM case can hold standard PSs, you lower the cost of the machine
by using readily-available PSs that you (or rather Atari) can get real cheap
in quantities.

>I use a 386 and of course have an ST.
>Personally, the 386 keyboard is all sticky, and ugh.
>the ST's doesn't stick. I don't type 40 pages a day unlike some of you guys/gals

Yes, but if you had a problem with the 386 keyboard, you could always
go out and find a keyboard that you like for a reasonably cheap price. If
you don't like the feel of the 1040 keyboard, you are stuck.

>I don't know, but You can _really_ feel a major differnce is keyboards?
>I can sorta tell a difference, but it doesn't bother me to the point of
>" ARARGH not an ST keyboard! where's my poison!! "

Yes, I can feel the difference, but no (IMHO) the 1040 is not so bad
that it is unusable. Just uncomfortable when used for long periods. BTW, I
MUCH prefer my TT keyboard.

>The case design:
>does a detachible keyboard and a tower case improve the computer any?
>people bitched about the TT's case as being "ugly", Looks fine to me.
>why worry about case designs and keyboards?

We aren't talking "it looks ugly" - personally, I find nothing quite
so distasteful as looking as a case that screams "conformity", "just another
PC","IBM". However, (read above) it is extremely utilitarian. It serves a
purpose. It is hard to satisfy one's acstetic (sp?) needs, ones system
requirements, AND keep it relatively inexpensive.

>I would think that if the falcon was just a 030 in a megaSTe case... then you
>could bitch about the hardware, nothing new, etc..

>I'm holding out for the 040, not because of the case, or keyboard,
>but that its going to be reallly fast.

Unfortunately, that sort of attitude may doom it to never come to
market: Why should they produce an '040 if their flagship economy (=large
volume) model never puts a dent in the market. In fact, they may not be able
to bring it to market if they sank too much money into the '030 without getting
a reasonable return.

Of course, you must realize that the '040 will not cost the same as
the '030 - and you may find that you won't be able to afford it.

>my point is that i have no point.. just voicing my opinions over the bitching.

Yes, it is bitching, but it has a point nonetheless.

mae@otter.hpl.hp.com (Mark Eve) writes:

>Address of any ftp site with a GEM to IMG image conversion program is all I'm
>after.

"GEM" files are vector graphics, while "IMG" files are raster graphics.

You could, for example, load a GEM file into Calamus or PageStream, and
print to an IMG printer driver in whatever resolution you want.

I tried to send mail to my GEnie self from usenet and got it back from the
GEnie postmaster saying that mail from here to there wasn't authorized. I
never really looked into it, but I suspect that a GEnie user may have to
authorize mail from the internet or some such thing.

3987. Atari TT with UNIX for sale

Newsgroup: comp.sys.atari.st
Date: 1992-10-14 02:41:27 UTC
From: bseufert@cuug.ab.ca
Message-ID: <1992Oct14.024127.13384@cuug.ab.ca>
Source record: 216217
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Atari TT with UNIX developer's kit for sale:

* 16 Meg Fast RAM
* 4 Meg ST RAM
* TTM194 1280x960 monchrome monitor
* TT is mounted in a full size tower case
* 1.44 Meg Floppy
* TOS 3.06
* Migraph Handscanner
* 48 Meg Hard Drive (TOS)
* 212 Meg Hard Drive (UNIX)

TOS Software:

* Calamus
* Calamus SL (with some modules)
* Wordperfect
* Datamanger ST
* LDW Power
* Outline Art
* Touchup
* TOS utilities: Cardfile, Steno/Stalker, Warp-9 etc

UNIX:

* Full developer's kit AT&T SVR4
* X-Window
* Motif
* X-Facemaker
* WiSH Desktop Manager
* GNU developement tools

All original S/W comes with reams of PD S/W on floppys

All licenses for the S/W will be transfered.

PRICE: ALL TIME DEAL FOR OVER $8000.00 of stuff => $3500.00 (US)

Email me if you are interested. Will ship to continental US/Canada

3988. Petra

> with text-capture (to file) feature.

> Rick Venable

True, but UUCP also allows you to send and recieve mail and UseNet news
directly from and to your Atari ST/whatever. A package does exist (in
fact several do, if I remember rightly). One is called Mercury UUCP (I may
have the name wrong), and I think one exists called Taylor UUCP. A UUCP
connection is a little difficult to set up, however, but once you've done
it, it is fairly straightforward to use - just like using mail and news on
a 'normal' unix system.

I have no experience of using UUCP, but from what I've read of the
Mercury UUCP documentation, it has the whole compliment of unix UUCP
packages, including uux (execute a command on a remote system) and
several others. The package is available on the atari.archive.

If you don't actually need a News or Mail feed, then [XYZ]MODEM/Kermit that
you'd get with a normal terminal comms package is probably better.

Can you buy a Falcon in the stores in Norway ? Has the marketing
begun ? Any ads in magazines ? Who are the "generalagents" ? Which business
are they into, the electrical, electronical or pure computerbusiness ?
It seems a good idea to have two generalagents, one aiming
at the games market and one at the more professional side such
as professional musicmaking.

>
>
> -Matt McCabe

I tried e-mailing you but it bounced so I'll put my thoughts here instead
to bore everyone silly.

Interesting question that, back in the old days of having a Amstrad
CPC computer with a Z80 chip, I bought a book on machine code
programming which had a few easy examples with the hex code for them,
the only programs I could write then were "hand coded" as I didn't
have an assembler - now that was REAL programming. Like all language
learning you start by writing short simple code like something to
clear the screen or put a sprite on the screen, its not much different
to learning a high level language where you write a short print "hello
world" type piece of code.

In assembly there are actually quite a few "words" as you put it,
except that rather than being one "word" to execute a whole process
(like print"hello") is just does one machine type instruction, like
add two numbers together (very glib example that).

In short, I'd say it is just like learning a high level language in
some sense, the BIG difference is that you have to write a hell of a
lot more instructions to do some simple task.

I love writing in assembler myself, at least then I know that I'm not
relying on someone elses code to make my stuff run fast, hell, I even
wrote an entire word processor in assembly, more or less just for the
hell of it - but it was damn fast! And being able to have an 80x34 text
mode on a standard ST was useful. Of course these days my simple word
processor is obselete as I have access to systems running X-windows,
but at the time it was damn good.

Also without being to write assembler I wouldn't have been able to write
any of the nifty 3-d solid graphics applications, as nothing else would
have run fast enough (even in pure *highly optimised* code its still too
slow for my purposes though - Falcons where are you?)

Ha, there is a German firm (yes again German :) that builds ST's into
19" racks. The things looked very sophisticated to me. It even provided
an extra midi thru port. And it had a very clean front. Just the reset
button and power switch on front. The backside had all the connections
the ST has plus a keyboard connector and the fact that the rom port had
been buffered. The case was also a lot flatter than I am used to from
my 1040STF. Great for musicians and I am sure there will be something
like this for the falcon. So nobody hesitate buying a falcon :)

From: baumer@cs.utwente.nl
Message-ID: <1992Oct14.102438.12585@cs.utwente.nl>
Source record: 216216

I have a quantum harddisk of 105Mb on my TT. Recently the harddisk was full, but when I did a 'du -s' I got as an answer 80 Mb. So there is about 25 Mb lost. I know about the 1 Kb blocks being the smallest unit of memory on the harddisk. So with about 4000 files this would result in a loss of (at maximum) 4 Mb. This would mean that about 21 Mb is needed to store the directory structure. This seems too much to me. Does anyone know what is the matter here?

I tried to use some disk-optimizers but they didn't seem to work with one partition of 105 Mb.

Greetings,

Han Baumer.

I read an advert yesterday claiming that the internal hard disk interface of the new Falcon030 is a IDE standard yet the external drives can run off a SCSI-2 bus. Is this true???

If it is then why do Gasteiner(sp?) and ultimately Atari hope to sell the Falcon with 64Mb HD for 400 pounds more than the machine without HD. One can easily buy a 100+ Mb HD for less than 200 pounds with an IDE interface. Intenal SCSI drives of similar capacity can be bought for less than 300 pounds.

> executing interpreter stuff, but TOS calls.
It depends an awful lot on what you're writing. TOS calls are mainly to do
with input or output (in one form or another) and most programs will want to
do something to the input before it becomes output. Exactly how much can vary
a lot 8-)
>Seems to me that even
> the best C compiler can't shorten the execution time of TOS
> calls...
No they can't, but they won't make them execute any slower either.

> Finally, the claim that a "C-ish" programming style automatically
> will compile to fast programs is considered to be folklore even
> by most C folks, including those who maintain FAQ sheets and
> such...

Maybe so, but then I never said that. I said that people learning C after
using basic will often simply write their C programs in a style suited to
basic. This will generally lead to inefficient code. I came into C this way,
and I shudder when I look at some of the stuff I wrote (way back) then.

Reminds me of a quote I saw somewhere:
"C combines the speed of assembly language with the ease of use of assembly
language" 8-)

Kev

4003. C compiler test (TC 2.0, LC 5.52, GCC 2.1)

Newsgroup: comp.sys.atari.st
Date: 1992-10-14 11:11:30 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <15052@chalmers.se>
Source record: 216224

A couple of weeks ago I ran a test to find out once and for all which
C compiler is the best one for the ST, ie which produces the fastest code.

I used the sources for MGIF 3.5, by Bill Rosenkranz, with some improvements.

The test picture used was a 263x394 pixel, 256 color image (52733 bytes).

The programs were compiled and run on my 4Mb STE.
All timings are approximate since I measured them by hand, but they should
be accurate to within 0.2 seconds, I think.

Turbo C 2.0 Lattice 5.52 GCC 2.1 Original

Load and unpack 9.4 10.6 9.9 26
+ draw on screen 32.6 34.1 33.0 66

Blur filter bl 35.0 13.2 6.0 71
Convolution 3 v 3 40.6 17.8 14.0 77
Hist. equal. he 2.6 2.5 2.3 3.4
Contr. exp. 2 co 2 7.2 8.8 9.0 16.1

Draw
with noise 50 n 50
and laplace 2 g 2 43.4 50.3 50.4 56.0

TC and LC uses register parameters, optimization and int = short.
GCC was used with the "-O2 -mshort" switches.
The values for "Original" are from MGIF 3.7, as distributed by Bill.

The time for the filters etc, were measured from the issuing of the command
until the screen cleared before displaying the new image.

As you can see in the table, the quality of the code generated by TC is far
worse than LC or GCC in the more complex functions.
If you look at the generated code it is obvious that TC does very little
"real" optimizing, but it's very good at register allocation.
From what I've heard about PureC, it should be the same.

LC is not very smart about the registers, but quite good at common expression
elimination and such things.

GCC beats the others hands down at code generation, but unfortunately can't
handle register parameters.

If you'd like to have the sources or binaries for my versions MGIF, contact
me by e-mail. I don't know Bill's position on distributing this, but I'll
try to reach him.

UUCP means "Unix to Unix CoPy" and is a fuzzy name describing a single command,
a family of file transfer protocols, a whole setup of programs, and a
philosophy :-)

> ly Xenix) machine? I figure if it's not known on this newsqroup, it probab-
> ly doesn't exist.

Several UUCP packages for Ataris exist. I wrote one, which is why I recommend
it :-) It is named "Hermes", and the current version is 1.04. Any good FTP
server should have it; if not, contact one of the better-known German servers.
Hermes lets you send and receive mail, news, and yes, files. The setup is
rather complex, especially for people not speaking German (because the docs
are mostly in German). But it can be and has been done. Hermes is shareware,
the cost is DEM 60 (about USD 50-60 including conversion charges).

But as some other poster said, if you really need nothing other then file
transfer, have your Unix friend install sz/rz, get RUFUS and off you go.
Then UUCP would be plain overkill.

MiNT still can't multi task gem apps. You need the new multi-aes which comes
with multi-Tos to do that (when it eventually hits the streets).

However, for straight TOS programs, MiNT is now definitly the business.
Multiple TOS windows, available from within a GEM program. Using GDOS
fonts within the TOS windows, pull down menus for TOS applications.
v0.95 was a revelation!!!

Once graphics support is implemented, we can throw away MGR altogether....

sanders@sci.kun.nl (Sander Stoks) writes:

>Ferrari-red of course.

Something like that but slightly more distinguished (Bordeau red) could make a very `desirable' machine out of the 040, somewhat like the Indigo. Maybe we should have it in different shades of grey (the colours of a Falcon).

>(Unless of course, they'd put it in an Iris Indigo-case. Now THAT's a
>nice box.)

But just a box, basically. The Falcon 040 should have a nice front panel. Maybe something in the shape of a falcon with its wings spread, like this:

```
---\ /---
\ \head / /
\ \---/ /
|\ /|
| \_________/ |
| | | |
```

Sorry for the rediculous drawing. Anyway, just like with the Indigo, one has to open a `door' on the front panel (that is, the door is the falcon logo) to access the disk drive. (Well maybe the logo should be smaller than I've drawn it but then the machine would look at bit much like the Indigo which we don't want.

Message-ID: <13Oct92185355wlm200@cyberden.uucp>
Source record: 216225

Comment:
Why hasn't anybody mentioned what seems to me to be the most likely reason for the Falcon using the STe style case: Wasn't that the last case that Atari managed to get FCC type B certification for? I don't recall ever hearing that the TT or the MSTe had gotten type B approval (a pity, really. I do prefer the detached keyboard).

Question:
I've been trying to get the PBM utilities working on my MSTe. I'm not using a command line, so I've renamed the files to .TTP. When I do this, they work just fine on my wife's STacy (with NeoDesk), but when I try it on my machine, I get lockups, bombs, and all kinds of garbage. I've tried dropping back to 8mHz, turning the blitter off, everything I can think of. Does anyone have any ideas?

Actually, if someone can point me to a program to convert Spectrum directly to a standard 24 bit format, ie Targa or TIFF, I'll junk the whole PBM package.

Either solution would be fine.

Thanx,
S.P.

4015. STOS updates for Falcon/TOS2

Newsgroup: comp.sys.atari.st
Date: 1992-10-14 13:56:49 UTC
From: evilandi@VNET.IBM.COM
Message-ID: <9210141414.AA18018@ucbvax.Berkeley.EDU>
Source record: 216230

Does anyone know if Mandarin/Jawx software have any plans to update the STOS BASIC suite of programming tools to make them compatible with the new Falcon, or indeed TOS2?

If so, will there be a complete re-write of STOS ("FLOS"!?!) to take advantage of the Falcon's full capabilities, or will it be another patch?

I currently have 3 STOSed shareware programs, plus another 3 Budgie UK licenceware proggies out; will I be able to convert these for the Falcon?

4016. PhotoChrome, GIF to RAW and PBM - HELP!!!

Newsgroup: comp.sys.atari.st
Date: 1992-10-14 14:42:07 UTC
From: morgado@vxdesy.desy.de
Message-ID: <1992Oct14.144207.1@vxdesy.desy.de>
Source record: 216231

I've been trying to convert GIF files to RAW format to be able to view them
using PhotoChrome, using the PBM utilities available on a.a.u.e.
I've attempted to do this in two ways.

1) giftoppm pic.gif > pic.ppm
ppmtoraw pic.ppm > pic.raw
The above steps I perform from within tcsch on MGR and MiNT. I then use
PhotoChrome on pic.raw and the program hangs after about three mins. By
hang I mean the pink scan line stops half way up the screen and nothing else
happens. Reboot is needed.

2) giftoppm pic.gif | pnmscale -xysize 320 200 | ppmtoraw > pic.raw
Again performed from within tcsch on MGR and MiNT. This is the suggested
method in the docs that come with ppmtoraw! In this case I get an error
...unknown magic number... from within pnmscale. This is strange since the
man page for pnmscale says it can take any of ppm, pgm and pbm as inputs.

I've also tried both methods with several gif files without success. I have not
tried method 1) with a gif file that is actually 320x200, so I don't know if
that would work.

Any help would be gratefully received.

> Unfortunately, most of the personal computer users out there today...

If you need Intel, get a PC: I'm sure it's cheaper to get an ST and a PC than to get an hybrid machine !
BTW: hybrid machines never had any success (remember CP/M and MS/DOS machines or other 68000/8086)

If you buy an ST, it's not to use it as a PC !

> Intenal SCSI drives of similar capacity can be bought for less than 300
> pounds.

> -Andrew

Don't forget the 64M drive is internal: there isn't that much place, so
that the drive is 2"1/2: it's quite a bit more expensive !
And the price difference is also for 4 MB instead of 1M

The price difference may be important, that's true. But what about other
companies ?
NeXT with 16MB is 1000$ more expensive than the same configuration
with 8MB !!
I can find 8MB for about 200$, and put them into the simms sockets myself !

Okay - I know there are people out there looking for these things. A mate and I are hacking together a superior quality unit (full stereo, input filtering, fully calibrated, or you can redo it yourself, true bipolar operation, 15us minimum conversion time - ie 66KHz stereo)

We plan to write some simple record-only software for the unit (it doesn't play back) and hack in some replay routines for the STe/TT.

At the moment, we think about US$150 would let us mail it anywhere in the world, but we're a couple months away from having a finished product, and we need some positive feedback before we commit ourselves to manufacturing them in any quantity.

>hearing that the TT or the MSTe had gotten type B approval (a pity, really.
>I do prefer the detached keyboard).
>

This is what I believe is going on and I bet I'm right.

The most sales that Atari has ever had since the 2600 was the 520 and 1040 ST.
The casing used was the one piece.

At this time, Atari figured it was because they got to the European market
first.

What they didn't realize was that the majority of people weren't buying it
for applications, they were buying it because it had FANTASTIC games.
It was also less expensive than the A1000.

Commodore then released their A500 and their sales soared. The Amiga was
originally built as a game system so programmers found that they could make
some very good games for it.

--Better than what they could on the ST.

More and more people saw that there were better games on the Amiga and more
and more people bought the Amiga--especially in the UK and then in Germany.

Atari realized that Commodore's come back wasn't due to applications for
Atari had better application software. Commodore's come back was a result
of the great games available for it.

They decided to build the ultimate low-cost gaming computer that could also
be used for other things such as VIDEO and MUSIC. They also put a DSP port
on it to give hackers something to have fun with.

Many hackers are game players and many game players are hackers.

The Falcon 030 has a perfect combination of everything that an average Atari
user wants.

1) It will play great games
2) It is hackable--boy is it!
3) It will allow musicians to make great music.

4) And it will allow great art and pictures to be produced on it.

Atari wanted to create a machine that could be mass produced fairly easy
and give the AVERAGE Atari user what they want.

A detachable keyboard is GREAT, but does the AVERAGE Atari user really need it?

How often do you need they keyboard to play games?

How often do musicians need the keyboard to play music?

Or artists to draw art?

Atari can eventually sell the FALCON 030 to stores such as WALDENSOFT
to be sold as a home computer.

If computer gaming is still around, the FALCON 030 case will be perfect.

As soon as the Falcon 040 is released (probably next year sometime),
the Falcon 030 will probably be lowered in price to around $500-$600.

The Jaguar video game system will probably be very similar for around $300.

For us serious users, Atari will give us the Falcon 040.

And I bet you that it will make the Falcon 030 look like a toy.

It will probably be in a PC-style case with higher graphics resolutions,
and a higher-end DSP chip. It will probably give us enough expansion slots
to calm us for another 5-6 years.

>I tried to use some disk-optimizers but they didn't seem to work with
>one partition of 105 Mb.
>

Remember that 105MB often is calculated as 105*1000*1000 Bytes, but if
you calculate the right way using 1024*1024 for a MB, 105 is actually
only 100.1MB (there goes 5 MB:-)
And when you have such a large partition, the clustersize (smallest
adressable storage space on the harddisk) is often (but not always) 4096Bytes.
There are however utilities available that enables you to alter this before
you start using the disk (just after partitioning the drive). The catch is
that the smaller the cluster size, the larger the FAT becomes, and the
filesystem will use longer time to find a given cluster.
Then if you say that on average you loose 1/2 cluster for each file, there
goes another 7.8MB (4000*2048 Bytes) and in addition, every directory takes
up another 4K, so if you have some 400 directories, you *loose* another
1.6MB. Adding all this up gives 14.4MB *lost space.
Calculating worst case shows a maximum loss of 25MB.
(I've not taken into account the space that FAT1 & FAT2 takes up, which
usually is about 80K on such a large partition)!

PS. When I say smallest adressable storage space, i do mean the smallest
storagespace the filesystem uses on ordinary file operations!

PPS. I MIGHT be wrong and/or even forgotten something, so please feel free
to correct me if I'm wrong!

>in a loss of (at maximum) 4 Mb. This would mean that about 21 Mb is
>needed to store the directory structure. This seems too much to me.
>Does anyone know what is the matter here?
The minimum block size is:

Partition size Minimum block size
<16 MB 1024 bytes
<32 MB 2048 bytes
<64 MB 4096 bytes
<128 MB 8192 bytes
<256 MB 16384 bytes

If your partition is 105 MB the block size is 4096 bytes, not 1024.
So you loose a lot of capacity, indeed.

>I tried to use some disk-optimizers but they didn't seem to work with
>one partition of 105 Mb.
Bad software if it doesn't work with all partition sizes.

>Intenal SCSI drives of similar capacity can be bought for less than 300
>pounds.

Oddly enough, it doesn't appear that the SCSI connector is accessible from
inside the case, so you can only use IDE for the internal drive. Also, I
don't think you can easily find a 100+ MB IDE drive that is a 2.5" form
factor for the price you're expecting. 3.5", yes, 2.5", not for that price.
I'm still quite perplexed as to why there is an IDE port at all, it would
have been more consistent to jus tuse the SCSI bus both internally and
externally. So it goes.

As another alternative, you could port the "tos" command from ST-Minix to your SPARC machine. That would probably take all of 5 minutes, and that would let you read and write to TOS-formatted floppies, without going thru the hassle of mounting a fake filesystem.

TVs *in europe* work at 50Hz. did you see what i said about PAL?
here in the US we use the NTSC standard, which is 60Hz but sacrifices
a few lines of vertical resolution for the stability.

>
> But the flicker I was talking about is easily seen with an all
> white COMPUTER generated picture.

how the image is generated has little to do with how it's displayed.
the display is still 60Hz (or 50Hz if you're not on my side of the pond)
interlaced which works out to 30 or 25 frames per second, half of the
generally acceptable 60Hz.

> >a -full- frame is only drawn on a TV every 30th of a second. half
> >frames (even/odd scan lines) are drawn at 60Hz. scan doublers

> >also the method 'flicker-fixers' on the Amiga use.
>
> Isn't what you say a particular phenomenon of NTSC? Anyway, there
> are definitely TVs with 100Hz refresh rate.

not that i know of. at least i know when i put my Amiga into PAL
mode it's just as interlaced as NTSC. there may be TVs with 100Hz
refresh rates, but it doesn't help any, since they're only still
only getting video information at 30 or 25 Hz. it's basically
just showing the same frame on 4 consecutive times.

> >is PAL standard. if i remember correctly, flourescent lights also
> >operate at 60Hz without noticable flicker. it isn't until they get
> >old and start 'misfiring' that you notice the flicker.
>
> Fluo lights and light bulbs are a different story because they
> consist of just one `pixel'.

doesn't matter. the eye has a limited reaction time. anything faster
than that time is imperceptible. 60Hz is just over the threshhold.
sure, you can go more than that, but i'd rather use the extra
bandwidth and money required to get it for more colours and resolution.

4035. Need help with OPUS

Newsgroup: comp.sys.atari.st
Date: 1992-10-14 20:00:33 UTC
From: vicb@clark.edu
Message-ID: <1992Oct14.200033.7808@clark.edu>
Source record: 216242

Greetings,

I am having a bit of a problem getting access to the charting features of
OPUS 2.2. After running the Assigner.prg and FONTWID.PRG, I get a
message from OPUS that screen and printer fonts don't match. Anybody
out there familiar with this problem? I've gone back and started from
scratch on my GDOS installation. I have original GDOS Distribution
and Fonts/Driver disks, and also have tried it with G+Plus. A friend
tried it for me on his system too and he got the same result.
I'm using a 2 meg STe, OPUS works perfectly other than this.

Help!!!

4039. Questions about colors and the vdi.

Newsgroup: comp.sys.atari.st
Date: 1992-10-14 21:47:27 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <81681@ut-emx.uucp>
Source record: 216156
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

In trying to fix the color in the Ghostscript screen driver, I have come upon the following problem: I want to use the vdi so that the code I write will work on all machines, but Ghostscript wants me to tell it which COLOR REGISTER a given color is in. The problem is that the vdi color indices (which all the vdi routines seem to use) to not correspond to the ST color registers.

Is it possible to use the vdi to either:

1) Set and read the palette using the value of the COLOR REGISTER and NOT the vdi color index?

2) Use the vdi to find the mapping between color registers and vdi color indices?

3) Get around this some other way?

For 2 and 4 bit color on a regular ST, I can just set up an array which maps color registers to color indices, but I think that this is not practical for larger palettes (especially since I don't know what the mapping is for the TT and Falcon modes).

Please do not send me information about XBIOS calls, since I am insisting on using the vdi. My GEM documentation is incomplete, and says nothing about any functions to manipulate the color.

Thanks,

-Tim Gallivan

I uploaded the STZIP2.TOS version to A.A and it was working, this came from
tu-berlin.de from memory..

NOTE: it is a self extracting archive, you must copy it to a blank disk
and then run it on drive A:\

Unless I forgot to select Binary when I uploaded it to A.A. it should work..

But many of us here in New Zealand have found that it produces corrupted
archives, gives CRC errors, this was with 50-70k pack ice (ICE2.4) files....

Mat wanted to point out that SunOS is a BSD derivate.

No Spectre version <= 3.0 is able to work with HD disks, neither Mac nor
DOS formatted ones.

I hope Dave will fix this in 3.1!
But as HD Mac disks are written in MFM format like DOS disks, no additional
GCR hardware would be neccessary to read/write/format Mac HD disks.

Regards, Markus.

4047. NeoDesk and MultiDesk problem

Newsgroup: comp.sys.atari.st
Date: 1992-10-15 03:20:36 UTC
From: elvis@watserv.ucr.edu
Message-ID: <22996@galaxy.ucr.edu>
Source record: 216161

Well, the other day, I was going through a bunch of old disks, seeing which ones I could erase and use again, when I came upon one of old games. One of those games was haunted, which had never seemed to work quite right on my color monitor (really, I am getting to the problem), so now that I have a multisync, I thought I'd try it in mono. Well, it didn't work at all correctly and I couldn't even see how to quit out, so I rebooted. When the computer came back up, I got two bombs when Neodesk tried to load, and it said to hit any key to continue. I did so, and got four bombs, and it froze up (even Ctrl-Alt-Del didn't work). So, thinking that there was just something in memory, I reset again, then getting more desperate, powered off and then on again. From that point on, I've simply got four bombs (occasionally bombs all the way across the screen), and a frozed computer. Through selecting what would load at bootup, it has come down to these two not working together any more. They work when I put just those two on a floppy and boot off it, but not if I remove everything from the auto folder and all accs from the root dir (except multidesk of course). Thinking that somehow something had happened to the hard drive, I backed everything up and formatted it. When I first just put NeoDesk and MultiDesk on it, it booted fine. When I restored everything else (but renamed the auto folder so it wouldn't load, and made all the acc's into acx's), it started bombing again. However, sometimes now it tells me its out of system memory and to try using Foldr100 to fix the problem. I'd never needed it before, but figured it was worth a shot, but after I installed it, I was simply back at the four bombs. All this has me very confused. They worked fine till I rebooted after running some of the games, and I'd really rather not have to give one of them up. So, does anyone have any ideas on this one? I can't think of what could simply be on the hard drive, but not running, that would cause them to conflict. Any help would really be appreciated.

Thanks,
Andrew Cullum (elvis@watserv.ucr.edu)

So did I, but still the majority of <=1Meg ST owners use their machines
mainly to play games. (Of course THEY should have bought an Amiga because
they're wrong publicity for Atari:- I lost count of the number of cases I told
people I worked with an Atari for serious programming and got the answer: `Oh
you've got an Atari game-computer?')

Ok, you need the program MSA (Magic Shadow Archiver) and a disk formatter that will do 11sectors and 82 tracks, I'd recommend Fcopy III or Pro for this. Then just follow the instructions in chaos.doc which is in chaos.arc; use ARC for this!

If it still doesn't work then either you haven't got a Megabyte or more of memory (if so, why did you download it?), or it got corrupted when you downloaded it.

Compatability: Chaos should work on any machine with 1Mb+ of memory whose disk drive can handle 11 sectors 82 tracks. I don't know about it working on the STe, TT or Falcon; any offers anyone?

>
>Thanks!

At the most basic level, it will let you run all your TOS and GEM apps exactly as before. Using one of the utility programs that comes with it, you can start up any number of TOS programs as background jobs from inside your favorite shell. Or you can get one of the many shells that have been ported to MiNT and have full BSD C-shell style job control. With one of a number of separate utilities, you can have any number of TOS programs running concurrently with a single GEM app. Those are the kinds of things you can use MiNT for if you're just interested in continuing to use your ST, and not interested in programming. If you're into programming you can take advantage of all the other Unix-flavor enhancements that MiNT provides, e.g., fork, exec, pipe, ptys, signals, shared memory, etc...

>I uploaded the STZIP2.TOS version to A.A and it was working, this came from
>tu-berlin.de from memory..
When I was putting stzip20 in our Atari archive I found two versions of
STZIP20.TOS on my system. One had a size of 125 kbytes, the other was 80
kbytes or so (I removed it, so I can't check the real size).
The small file was corrupted. It refused to extract itself (no bombs or so, it
just did nothing), and I couldn't extract it with any archiver program.
The big file extracted itself without problem. I tried the program, and it
seems to run fine.
Btw: the big file was the older than the small one.

>NOTE: it is a self extracting archive, you must copy it to a blank disk
>and then run it on drive A:\
Worked on drive D:\STZIP\ as well.

I've put this version of STZIP20 in our archive.
Note: It's not an self-extracting-archive anymore, I created a zoo file.

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'STZIP20' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/utils/stzip20.zoo
Don't forget to set binary mode !!

--> How to get 'STZIP20' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

```
| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/utils/stzip20.zoo
end

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level
directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

Ate Brink

The whole thread has gotten a little confused. The original question, to which I was replying, was "Why is X11 on a Sun 3/50 faster than X on the TT?"

I was pointing out that Sun 3/50 Unix is derived from BSD 4.3, which is generally faster than SVR4 on the same processor. Yes, I know TT Unix is indeed SVR4 -- I've used it!

According to a Dutch SR Magazine, Borland has sold the rights to Turbo ST back
to the original developers of Turbo C : Applications Systems Heidelberg in
Germany (also I believe the makers of Signum!)

I know that in the Netherlands Pure C is available through a importer of ASH:
Jotka Computing B.V., for a price of Hfl. 489,- (1 Dollar is approx. 1.6 Dollar)

This is just what I read......

Jeez, I always thought TurboC 2.0 was BY FAR the best C-compiler ever designed. Are you very sure about these figures? I read a review on C-compilers for the ST (a long time ago) which compared Lattice, Turbo C (version 1 back then, I believe), Mark Williams and Laser C (maybe one other too) and Turbo won it by far: Fastest code, shortest code, fastest compilation.

To think I was already in the process of buying me a copy of PureC... I reckon I'd better check out GCC, huh?

Still think there's something wrong with these figures, though. Are you sure you didn't forget some optimization switch or something?

Nope, this wasn't a typo of mine, more of a speako of Tramiel. Never mind though, it was an issue of early 1991 if I'm correct. And Atari has been known to promise things they can't keep. In the same interview Sam says the problems with Chinon are definitely solved, and Atari CD-ROM players would be marketed RSN. :-)

Chaos works fine on a 2Mb STe - the only problem I had was that I re-formatted
an already formatted disk to 11/82 (using FCOPYIII) and couldn't get it to
work at all - I eventually had to format a completely new disk and it
worked fine.

Don't forget: Turbo C generates good code from ground up. So that
it feels it doesn't need an optimiser. But sometimes a good optimiser
can make you win some time (and some place).
Don't forget also that GCC is a huge C compiler designed for Unix for
professionnal use, written by a lot of men, etc...: it has an optimiser, and
a very complex one: that's why it may get a real improvement over Turbo C

You should check out GCC if you have room on your HD: it's becoming
the de facto standard on ST (and unix) if you use MiNT and other unix-
like utilities. And it's FREE ! (and has a good debugger although not as user
friendly as PureC's one)

Hi All,

Can anyone tell me why I can't FTP to atari.archive.umich.edu. I've tried using the internet address too but that doesn't work either. Here's the responses I get:

```
Command> ftp atari.archive.umich.edu
atari.archive.umich.edu: unknown host

Command> ftp 141.211.164.8
ftp: connect: Host is unreachable
```

I can and have used BART but would much prefer FTP. How do I post stuff to a.a if FTP access is not possible ??

Thanks,

Grant.

>advantage of the Falcon's full capabilities, or will it be another patch?

Personally, I would like to see a totally new version, rewritten in the style of AMOS, ie with a proper edit/run environment rather than the old 8-bit basic type environment. I would like a version which would be able to produce programs to run in a single-tasking mode (eg for writing games) or to produce a more serious style application to multi-task under MultiTOS. But then that's just another item on my wish list...

I'm not even sure if Mandarin/Jawx are serious about supporting the ST any more. Witness the years of delay of the release of STOS 3D while they worked on getting ALL the AMOS suite out the door.

>
>GCC also uses 64 bit doubles. I also thought that Jwahar Bammi fixed up
>the register-passing stuff so it was usable in GCC, but I haven't tried
>it myself.
>--

MGIF doesn't use any floating point math whatsoever.
As an example, the blur function:

```
int blur (uchar_t *pras, int w, int h, uchar_t *ptrans)
{
uchar_t *pr;
uchar_t *pt;
long x;
long y;
uchar_t *ps;

pr = pras;
pt = ptrans;
if (pras != ptrans) {
copyrast (pr, w, h, pt);
}
ps = pt;
for (y = 1; y < h-1; y++) {
for (x = 1; x < w-1; x++) {
ps[(y*w) + x] = (uchar_t) (
( (uint_t) ps[(y-1)*w + (x-1)]
+ (uint_t) ps[(y-1)*w + (x )]
+ (uint_t) ps[(y-1)*w + (x+1)]
+ (uint_t) ps[(y )*w + (x-1)]
+ (uint_t) ps[(y )*w + (x )]
+ (uint_t) ps[(y )*w + (x+1)]
+ (uint_t) ps[(y+1)*w + (x-1)]
+ (uint_t) ps[(y+1)*w + (x )]
+ (uint_t) ps[(y+1)*w + (x+1)]) / 9);
}
}
```

```
return (1);
}
```

As you can see this is pure integer math, but still the code produced by GCC
is faster by a factor of six over that by TurboC.
This is all due to TurboC's inability to optimize the array index calculations.
TC actually computes nine multiplications within the loop above. Since the loop
runs (263-2)*(394-2)=102312 times and y is declared long, this adds up to quite
a few calls to the multiplication routines.

Regarding register parameters in GCC, someone posted patches to Minix GCC 1.40
for this last year (I think), but I don't think it's been included in the
normal GCC. Please, correct me if I'm wrong.

It would have surprised me enormously if TC had beaten the other compilers,
considering that it compiled the code in a fraction of the time.
It's not simple at all to do the optimizations that GCC does with -O2!

TC is indeed better if you compile simple programs that can use the register
parameters and extra scratch register (d2) to full advantage, but it doesn't
seem to be able to even move loop invariants out of the loops.

Again, the source is available to anyone who would like to test their favorite
compiler. :-)
So far I've only received requests for the Lattice sources, but perhaps someone
with PureC would like to try it?
I'll try to merge the sources into one generic version.

By the way, Bill Rosenkranz has told me that MGIF is PD, so perhaps I should
upload my new version (one of them) to atari.archive.

The thing is that the IDE interface was originaly developed for the ST-Book.
And would you guess it: it is actually the blitterchip that is used as the
main part of the IDE interface!!
I guess the main reason they used IDE internaly is the lower prices on the
IDE drives. And one of the reasons to also implement SCSI II on the Falcon
was the large numbers of different devices available for SCSI II. I think of
things like scanners, tapedrives etc.

Does anyone outthere has more information about this video tapestreamer, some german company should be selling by now?

It was first mentioned a half year ago in a paper (which is called ACN). Then the release of this magic box was prosponed until August/September. Again ACN writes that this video streamer should be available by now somewhere begin September. I still haven't heard since.

It's about this little box that makes a tape streamer from your video. It can put upto 640 Mb on a 240 minute tape. With a price of $15 for a good tape, this means less than 2 and a half dollar cent per stored megabytes. You might want to compare this to other media, but it's bloody cheap.

I believe it was said to do about 1 Megabyte per minute, but considering a normal tape speed you'd have to do 22.5 sec for each Megabyte (2 2/3 Mb/sec).

Well it's sounds cheap, quite fast (ok, faster machines are available, but this is much faster than normal floppy's anyway), so it's price will probably be very high. Well,..., it's not. It should do about $125 with software.

My questions are:

o Has anyone seen or used this system?
o Are those specifications true indeed?
o How does the software work? Does it have a nice user interface? Can I dump several files, dump a whole disk (logical and physical) and still get only some files (selected ones, or all new ones).
o Does it work with the parallel port or DMA ? (I really would like SCSI BTW)
o What's the connection to the VCR. Do I have to rewind and position it myself, or do I only have to wait for four hours to get the last files? Does it ask for specific kind of VCR's?

Hermes offers all exept FTP, and is userfreindly when installed. It is NOT
easy to install if you don't know a shit about sitenames, usernames, hostnames,
sys-file etc. I use Hermes V1.03 (there should be a v1.04 available too) and
are pleased with it. It will run well on a MSTE4 with at least 5-10MB free
diskspace.

It is because of the IBM compatibles, I'm almost sure of it.

Also, you had several people making the decisions at Commodore, not just
Jack Tramiel.

When you have more people to debate the steps needed to be took, you usually
take the right steps.

> task-switching of ordinary (legal) GEM programs like WordPerfect
> and Flash II?

You can multitask any number of TOS/TTP programs, plus 1 GEM program.
(The 1 GEM program restriction will, obviously, be lifted in Atari's
MultiTOS.)

> what of PowerDos (I hope I have the name right--I mean the OS patch
> from Dragonware)? Willit at least let you task-switch with ordinary
> programs?

PowerDOS claims to be able to multitask the same as MiNT, i.e. any
number of TOS/TTP, plus 1 GEM. However, from the slew of "I can't
get programs to multitask under PowerDOS" messages appearing on GEnie,
I gather this is extremely difficult to achieve in practice and
involves grovelling through the configuration file.

> And what about easy set up directions for MINT, which is
> wee bit tricky--is there something of that nature in the MINT folder
> on atari.archive.umich.edu?

MiNT 0.95 is easy to set up; you copy mint.prg to the AUTO folder,
and then (if you want to make multitasking really easy for yourself)
you copy TOSWIN.ACC and TOSWIN.RSC to the root directory of your drive.
Then you reboot. To run a TOS/TTP program in the background, you
select "TOS Programs" from the desk accessory menu; a file selector
will come up, you select the program you want to run, and TOSWIN will
open up a new window with the program running in it.

If you're comfortable with CLIs, you could instead download MiNT aware
CLI's like tcsh and bash and use the Unix notation for multitasking
(e.g. "foo &" runs the program "foo" in the background).

Yes. I've been on the net for the past 2 years.
Yes. There's a new version GER2EN21.
New features:

- 27500+ word dictionaries
- Up to 10 different dictionaries can be used at one time.
- Fonts menu: About 20 fonts can be used (only tested in color)
- Some other improvements.

Carlos Varela.

My analysis has been that the Tramiels planned on the "demise" of the ST in the US. I don't think they planned this from the beginning in 1985, but it seems that after the growth period in 1988, everything started to go downhill and that's when they decided it wasn't worth their while to push it. Why push something that you know isn't going to go anywhere?

Now, a lot of people, myself included, know that the ST is one amazing computer that can compete with MS-DOS machines and Macs. Despite that, I think the Tramiels saw that the ST technology wasn't going to last too long, and instead of giving it a big marketing push in '89, or '90, just let it go by the waistside and concentrate on new technologies, like the Falcon I suppose (when was the STE introduced?). Perhaps the big problem with the ST and mass marketing it in the US is its screen resolutions. They can't compare with VGA and SuperVGA, yet that's how people compare machines in our marketplace.

I've heard indications that the Falcon is the new beginning. They want to start off like they did in 1985, and get the growth period in the US that they had in 1987-88. They announced the Falcon at the Boston Computer Society show in September, just like they did in 1985. What's different this time is that Atari is in better financial shape than they were in 1985 and there's tons and tons of excellent software that's already out there.

Could it be cost of the drives? Are 2.5" IDE drives less expensive for the consumer than 2.5" SCSI drives (if there are any around)? Perhaps Atari wanted to provide an inexpensive hard drive solution for the Falcon and IDE was it.

>know which one it will be. :-)

There was a post recently stating that someone saw resumes from a couple
of engineers at Atari and one of their latest accomplishments was the
completion of the Falcon040.

I'm sure Atari's been working on it simultaneously with the Falcon030. They're
not going to say, "Okay, we're finished with the Falcon030. Let's start
the Falcon040." They're probably working on them at the same time.

Atari could very well introduce the Falcon040 at COMDEX. Apparently a lot of
applications and stuff (<-- good word) are going to introduced there from
several Atari vendors.

Yes, FCC type B certification was granted for both the Mega STe and the
TT (I believe the Mega STe was first, the TT to start with only had type
A certification).

>Does anyone have any ideas?

I don't believe you can use these utilities as .TTP programs. I tried the
same thing on my 520 and it doesn't work. The problem is you need to
redirect the output (since the utilities use the standard output) to a
file, for example :

shell > giftoppm pic.gif > pic.ppm

Gulam works just fine for this type of stuff. I don't know the reason
for the bombs and things, but you have to do this process from within a
shell.

>I gather this is extremely difficult to achieve in practice and
>involves grovelling through the configuration file.

From what little exposure I've had with PowerDOS, there isn't much grovelling necessary. Problems running programs are similar to problems running certain programs under MiNT. There are always non-compatible programs in a multitasking environment, especially one where memory is not and cannot be protected from the programmer! There are usually workarounds for these type of problems -- MiNT, being more mature, has solved a large number of the problems encountered early on. PowerDOS will probably do so as well. Given the fact that PowerDOS isn't being experimented with on as massive a scale, there will probably be a longer time frame involved.

If there are interested parties, I can see about posting the latest full set of PowerDOS programs and applications to the atari.archive server.

>MiNT 0.95 is easy to set up; you copy mint.prg to the AUTO folder,
>and then (if you want to make multitasking really easy for yourself)

>select "TOS Programs" from the desk accessory menu; a file selector
>will come up, you select the program you want to run, and TOSWIN will
>open up a new window with the program running in it.

Of course, if you want to use some of the MiNT utility programs, you have to modify the MiNT configuration file -- documentation for this is a lot better than early PowerDOS documentation...

Then again, if you get bold and start trying to use some of the more advanced 'features' of TOSWIN (such as pull-down menus for applications), you're going to get bogged down in the cycle of experiment-bomb out-reboot-experiment until you get things tuned just right. The more complicated you get, the more careful you have to be to have your hard drive backed up on a regular basis! (I assume everyone here backs up their hard drives before installing major changes to the GEM/TOS environment?!?)

>If you're comfortable with CLIs, you could instead download MiNT aware
>CLI's like tcsh and bash and use the Unix notation for multitasking
>(e.g. "foo &" runs the program "foo" in the background).

But you should expect to run up against a wall while trying to ensure that these programs actually run correctly -- configuration files, environmental profiles and the now-infamous (and unecessary, under MiNT) UNIXMODE can be quite confusing to someone whose only experience with CLIs has been running GULAM. I gave up on the BASH CLI because I could never get it to correctly access the system profile file, and also because there are no built-in shell commands for doing simple things like getting a listing of a directory. Including the GNU File Utilities helped a lot, but at the expense of a massively large amount of disk space taken over by programs which did little or nothing which the much smaller 'all-encompassing' shells can do.

A side note to those of you who are using UNIXMODE in coding your programs -- don't. It just makes it that much more difficult figure out whether the installation instructions you've given are bombing out because of the UNIXMODE being set up incorrectly, or because of program incompatibilities, or because of faulty installation instructions. EMACS 18.58 comes to mind as a perfect example of a UNIXMODE program which proved worthless because of a combination of the above. [Note: read that as 'worthless to me' ... I understand that others have gotten the program to work quite nicely for them after a bit of struggle].

Any CLI which has to call a 200K+ program to process a TOS directory listing is simply not worth the time or trouble. And, when you add in 200k+ programs to create or remove a directory (or file), you get a feel for the ponderous quality of these MiNT-aware CLIs...

There ARE CLIs which work nicely under the TOSWIN accessory which don't require megabytes of disk space for standard shell utilities. I've seen a very nice setup using a CLI and a MicroEmacs editor in two TOSWIN windows which provided most everything one would need for background processing. Telecommunications in the foreground even worked tolerably well under these circumstances.

Folks should really experiment a bit with the multitasking options available to them now. MiNT works nicely; PowerDOS works but is a bit sketchy on the documentation side of things at the moment. One can only hope that MultiTOS comes out shortly, and works across the line of 68000-based Atari ST computers.

>message from OPUS that screen and printer fonts don't match. Anybody

Opus screen and printer files must match sizes one to one. If
you do what I did and used the fonts from an existing program (mine
was Timeworks DTP I), and used those fonts, you'll have to edit the
assign.sys such that there is a one to one correspondance between screen
and printer fonts, i.e. shelvtica14 => phelvtica14 (I faked the naming
scheme coz I don't remember what it was).

As a result, you will have much less fonts available that in
Timeworks, but the charting funciton will work.

This info is in the docs that come Opus, however

This is, IMHO, the greatest threat facing the computer industry in this next decade - There are only 17,576 TLAs (Three Letter Acronyms).

Heh, I've been using the phrase "PIM" ever since I first saw one on a PC, and made a better one for my Atari 8-bit (but mine wasn't a TSR).

Those stupid games... Why do I play them ?
Please help me if you know any answers to the following riddles:

Legend of Faerghail:
What is it, that not many like, but directs even the greatest of
King's actions. It's much like a sword, but it never draws blood
even though wounding thousands. It thieves no-one but it does make rich.
It spans the whole earth and makes life fit. The greatest Kingdoms
it has founded, and built the oldest of them all, but never has it begun
a war and the peoples who trust in it will live in plenty for ever more...
I know the answers to the two others: fire & stairs. But this one ??

Chaos Strikes Back:
After that Demonical Demon Director and seven dragons, hellhounds and golems,
I reached the altar room with the corbum of the way of the Fighter.
But every time I try to take it out, a panel activates under my feet and I
keep falling down.
How do I get the corbum out ??? Is there some secret button, then where?

Knightmare:
After the sewer enterance, the spider leg, where is the exit ?

Return to Eden (part II of the Silicon Trilogy):
I am on a tiny island at the brink of an awe-inspiring waterfall
shrouded in spray. The only exit is down -
leading to a sure death.
I have a dry bulb, a pill, spade, tubers, and a stem.
If I have to make a parachute with the bulb, then how? How do I get to
the city of Eden?

Phantasie I:
I have visited the Gods, collected all the runes except WATER.
I can't find it. Do you know where it is ?

Auto Duel
I just screwed up a disk of Auto Duel, that brilliant sim by Lord British
Problem is: I had no backups and the disks are not mine. I borrowed them
from a big strong Fantasyfan who will be pissed. If he ever finds out, he'll
probably format my head until it is has 3 1/2" size...
So if you have a copy left somewhere... please inform me.

4098. I've seen the Falcon and Dave Small is way cool

Newsgroup: comp.sys.atari.st
Date: 1992-10-15 18:34:23 UTC
From: chang@ADELPHI-ASSB01.ARMY.MIL
Message-ID: <9210151834.AA09128@adelphi-assb01.army.mil>
Source record: 216254

Funny, seems no other csas netfolk attended the WAACE
atarifest (Hutch doesn't count coz he's a vendor) or if they did,
they just didn't choose to write about it. Well.... I went on
the first day with basically 3 things in mind,

1) Shop for stuff at a good price
2) Check out the midi
3) Catch a glimpse of the Falcon.

Well lets see how I did.

1) Picked up some knicks and knacks. SOme utilities and
instructional stuff. No games coz I bought a REAL game machine the
Super NES since my unfortunate addiction to Street Fighter II. I've
been holding back as I want to save up for Falcon specific
software/hardware. Unlike those who voice their opinions, I don't
really care that much about running ST software on the Falcon, I want
something that uses the ability of the Falcon. It's this backwards
compatabilty stuff that has crippled the intel family --- I've got a
33 Mhz 486 that runs my 8088 (sic) program... So as long as cool
animation/graphics/video (I hope lexicor is hot on this), midi/direct
to disk stuff, come out I'm definitely going to pick one up. Games
will off course exist as it is an ideal games engine (it's even packaged
like one), and the gnu/MiNT/unix conversion stuff all have source code
and the falcon will do everything I want it to.

2) Midi. For a computer that is toughted as the a big player
in the midi market (one of my main concerns when buying my original
ST), it sure had a small showing, IMHO. Not much new happening here,
which is unfortunate. At least it's good to know that Steinberg Jones
claims to be an Atari Company 1st and foremost. I speculate that this
may change as the Windows version of Cubase is selling like hotcakes.
I attribute this to 2 factors 1) DOS/Windows sequencers still suck
2) Cubase for WIndows is ~ $200 (US) less than the ST version. Hopefully
the falcon will make a dent and spearhead affordable midi with digital
sound recording systems. But remember, midi people will often want
to use their comptuters for something else besides midi. DOS/WIndows
sequencers sell coz many people already have PC's (for whatever uses)
and may like to dabble in midi, so they pick up a sequencer and a midi
card and they're playing vs. picking up another computer and the software.

3) THere were a few falcons around, but the man of the hour, as
is often the case is Dave Small. He had his booth outside the main room
over where the users groups usually have booths and he was demoing his
falcon constantly. I figure his reasoning was that since Atari wasn't
going to do it, it was up to him to show off the falcon. I didn't see

any off his products (did see a sign up sheet for the chromax video board) and any trying to sell anything, just him CONSTANTLY showing his falcon out. What altruistic man...

So then, my impressions. Mind you, just impressions. Some of these are shallow remarks, but I am giving you my _impression_ (no flames please)

1) Nice graphics. He had the falcon with a toadfile HD hooked into a commodore 1084S monitor (yes the very same amiga one). Colors are nice and fast.

2) Flicker mode is annoying. To quote Dave, "Bery Bad" (two octaves lower than his normal voice). Pictures look nice, but the desktop is quite painful. Looks a lot like my friends souped up amiga with the Firecracker 24 bit board that interlaces on a C 1084 monitor.

3) Default colors hideous. THe old black letters on white, with a green background was pretty bad, but the new ones are even uglier. They do have 3D buttons and sliders, that look kinda strange with the old colors.

4) Some resolutions look unprofessional. I've always hated the look of the medium res vertically enlongated look. The falcon has corresponding modes, more colors and pixels, but the same enlongated look. The color macs aren't enlongated and as much as I hate macs, they look better. I was hoping for a resolution that had the same proportions as mono mode but with colors (like Mac II and ilk). Maybe it's there and I didn't see it.

5) Too many resolutions == problems for users. Dave was showing various demos and 7 times out of 10 in the wrong resolution. The was resolutions are picked is you bring down a menu that has things like, # of columns, # colors, interlace/no interlace. THe demos run whether or not the resolution is correct. Dave had a lot of funny looking stuff and hit the reset button a lot of times. If programs can't set the resolution themselves, then there will be a lot of problems like this.

6) Sound, cute. I'm one of those waiting for the 8 track direct to disk software/hardware. Dave showed quite few sound demos, mostly using the sound manager (or something like that) that binds any sound to all kinds of events, system crash, opening and closing windows, bootup, etc. He demonstrated the built in sampling. Cute, but not too much functional value.

7) Case very ugly. 1040STe case, but dark brown keys and ugly name play with yellow print. When I get one, I will do what Brett Maraldo (I think it was him) did to his ST, paint it black. NO names, just black. I'll need to find some white keyboard decals first tho.

Lotta bank for the buck. If my previous desires for the software are met. I'll buy one. As for support, I've been supportless (not including csas) ever since I've owned one and expected it. I'll

have what I want, and that will be enough

Fo

4099. Re: A question & a comment

Newsgroup: comp.sys.atari.st

Atari are using the older STE-type case for the Falcon, because they still had a LOT of them sitting in a ware-house/storage area. (Or so ST-Report stated)

Well, in the October Atari Advantage it says (in the editorial section, I think), that the F040 is to be unveiled in November (yes, next month), but Atari is trying to keep a lid on it until then, trying to sell the F030.

I haven't got the archiver (msa_141.lzh) to work either.
It loads OK, but when I try to unpack the chaos1 (2).msa it screws up the disk I am unpacking to.
BTW I did *exactly* what the docs said to do and even some guesses!
Please help us chaos lovers!

You guys can't be very serious believeing Atari promises. I can buy
the A4000 at a dealer NOW.

I don't want to start a flame war, but this comments go to those
fanatics that kept saying that the Falcon will bury C= (Jeff Young?).

To those that are realistic out there, I wish you luck.

I think it is silly to base your verdict on one program (MGIF).
As this is a graphics program it's structure may differ from
ordinary programs.

In a recent test in ST-Computer (6/92) Pure C beats Lattice
clearly.

How about testing compilers compiling MINT or (if you're ambitious)
the C part of the SPEC benchmark.

The same way they released the Jaguar, Falcon030 and about everything else.
I am still waiting to hear from somebody, "Hey, the Falcon will have a can
opener built-in!"

You have to understand, the Tramiels are very cheap and have full control
over the entire company. Unless they sell the company, nothing will change.
It is very interesting as to ALL people I have argued with over the last
few weeks (at least 4) on different networks, 4 of them are pirating
software and I doubt that they ever purchased their software. Isn't it
interesting to see people flaming me, at the same time I have clear evidence
to who they really are (written proof). I am just waiting for the perfect
moment to appear and exactly the same people will have a VERY nice surprise.

Hey, sure I would love any Atari computer. I wouldn't have to go and search
for a dealer to buy the software, I just download it from a pirate BBS.
This is wonderful, isn't it? Well, that's not the way it works.....

Regards,
Mark K.

Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of
humor.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways),
Emily has taken time out of her busy schedule to answer a few commonly
asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,

and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

```
No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

What is Free-Net and how can I get access?
=========================================

A "Remodeled" Atari S.I.G. Opens
```

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

Mark Leair

:MAGS:
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

No more info right now...

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

START, published by Divo , M. Gijzenburg 14, 2907 HG Capelle a/d IJssel
---
cover price: fl 7,50 (may be more now)
All round magazine, floppy-service available for published programs.
68 pages. 2 color print

6 publications a year. One year subscription fl 39,95
including floppydisk fl 119,95

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram

both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window. (I've been told this will work on 1.2, and possibly other TOSi.)

:ZNET:
Where can I get copies of ZNET?

==============================

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==
Atari Explorer Online magazine is available on CompuServe and GEnie. You can
also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
===

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a

help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

archive.cs.ruu.nl [131.211.80.17]

:COMP:
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Archive-name: csas-faq/part2

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

The following is an index of the questions answered in this part of the FAQ. For easy access to a particular question, search for the tag surrounded by colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
ARCS How do I deal with Archived files (.ZOO, .ARC, .LZH)?
CLI What Command Line Interpreters are available?
ERR What does TOS ERROR nn mean?
GDOS What is GDOS, and where can I get it?
GNU What GNU software is available for the ST?
HAM Where can I find Ham Radio software for the ST?
LANG Public Domain/Shareware languages...
MINIX Is MINIX available on the Atari ST?
MINT What is MiNT?
XWIN Is there a version of XWindows for the ST?
DEMOS Why won't demo x run on my machine?
PAINT What is the format for [x] paint program data?
PD Where can I get Public Domain/Shareware software?
MAIL E-Mail file servers
FTP Anonymous FTP servers
TEX Is TeX/LaTeX available on the Atari ST?

:WEL:
Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe, and the Atari TT. There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented. The newsgroup serves as a resource for Atari users ... feel free to contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:CLI:
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4
Bad request...................-5
Seek error....................-6
Unknown media.................-7
Sector not found..............-8
No paper......................-9
Write fault..................-10
Read fault...................-11
General error................-12
Write protect................-13
Media change................-14
Unknown device..............-15
Bad sectors on format.......-16
Insert other disk............-17
Invalid function number.....-32.....1
File not found..............-33.....2
Path not found..............-34.....3
No handles left.............-35.....4
Access denied...............-36.....5
Invalid handle..............-37.....6
Insufficient memory.........-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46....15

No more files...............-49....18
Range error.................-64....33
Internal error..............-65....34
Invalid program load format....-66....35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

[unassigned, reserved].......48-63
User Interrupt Vectors......64-255
```

```
:GDOS:
What is GDOS, and where can I get it?
====================================
```

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.2.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)

Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME

SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?

=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN:
Is there a version of XWindows for the ST?
==

Currently, there is no XWindows port for the ST. It is quite unlikely that there will be one, although you are free to port it if you like :-). There does exist a port for the TT (and presumably Falcon) as part of Atari's Unix distribution.

:DEMOS:
Why won't demo x run on my machine?
===================================

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
===

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you

first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

archive.cs.ruu.nl [131.211.80.17]

:TEX:
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the

atari.archive server.

The latest version of TeX (3.14) has recently been made available on the atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0. This consists of 8 disks full of TeX stuff, plus an installation program that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:FALCON:
What are the specs on the Falcon?

==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

Distribution is beginning soon in Europe, and by late October in North
America

:ACCEL:
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES:
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put the drive internally, you will need a case with power supply to house the adapter and hard drive. IBM case is very easy to get and has a lot of space for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive they use about 20 watts or less, Quantum LPS drive use about 10 watts each, make sure your power supply has more than the drives need. Again if you use IBM case, the 150 watts power supply for that type case can drive at least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL), it's 50pins IDC female connector on each end with 50 conductors cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome

* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?

==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that

a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========

4109. What kind of monitor is BEST with a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1992-10-15 21:25:21 UTC
From: smiller@bnr.ca
Message-ID: <1992Oct15.212521.27966@bnr.ca>
Source record: 216262

I have a question for anyone who has a Falcon. (I realize that this is a fairly small subset of c.s.a.st readers - the developers)

What is the way to go as far as a monitor is concerned? I have been reading about overscan, flicker, true-colour, etc. But what I want to know is, what is the best way to go?

I can get an SC1224/SC1435 fairly cheaply. This I can use directly with my ST until Falcon-time. I can get a regular VGA monitor, which is also cheap. Or, I can get a SVGA multisync, and use it with any conceivable setup in the future. Would it be worth the extra money?
(I currently use an SM124, and a TV for games and such. The TV isn't really good enough, even on the ST. But it's free.)

Is there any difference between the SC1224 and the SC1435? (as far as the Falcon goes)

An unrelated point - There have been a lot of posting to the effect that 'Gee, I hope the Falcon040 has a 96000 DSP'. I assume that these people think these are binary compatible, or that they think Atari is MORE stupid than they seem. Why would a non-suicidal company build in incompatibility like that? Now, maybe more 56000 RAM. That would be cool, and transparent to all but the OS. SIMMS, too. There is NO WAY Atari can put out memory cheaper than SIMMS can be bought for. What was the justification for this?

Another unrelated question - Does anyone know of any killer flight simulators under development for the Falcon? Alternately, what ST-flight sims RUN on the new bird? (i.e. Can I use Falcon on the Falcon?) What other software runs? Are developers allowed to talk about this yet?

Is there a really good Othello game for the ST? I remember an old one
called "Flip Side" I think but it plays a crap game. One of the best
othello programs I've seen is the old Reversal for the 8-bitters.

To all Atari users: I would like to adress this problem of mine
with the hope of gaining you understanding.
You see like many of you I grew up on the original Ataris.
Yes the old 8-bit (800 Xl to be exact), and it served me well.
Many colours, nice sound, good games, and my Math lecturer
at my old College even wrote a 300 page book on one using
Atari writer. I want to buy a Falcon or should I say am
thinking of buying one so I posted several Articles about
the Falcon on this and other Newgroups and most first time
readers of my articles were stunned by the capabilities,
in fact a whole bunch of guys from the next group thanked me
for posting it. I NEVER DARED TO POST ANY ON THE AMIGA
GROUPS COS I KNOW HOW FANATICAL THEY ARE, never the less I
will now show you one of the responses to my private mailbox
by probably an Amiga user who discovered this article and
dumped it my private mail box I thank him for informing me and
I would like your your opinion to what many of you would
call SLANDER (I RESERVE MY OPINION) :

ORIGINALLY FROM comp.sys.amiga

>Lines: 83

>>>>>>>**********BEGINNING OF CONVERSATION**********>>>>>>>>>>>>
I recently got the chance to see a Falcon at the European Computer Trade
Show. Atari had a small stand there, the first time they have had a stand
at *any* show for several years now. There were not all that many people
interested in the Falcon, judging from the few who were in attendance.
Some of Atari UK's top brass were there as well. I stopped by, pretending
to be a casual onlooker. One of the Falcons was running a space flight
simulator. It was SLOW (not sure whether this was due to bad programming
or the crippled graphics bus). The Atari person demoing the machine kept
rebooting it to show the new GEM desktop, some still graphics, a paint
package that utilises the new palette and this space simulator. During one
of the GEM desktop sessions, I started to grill him. It went something
like this..

ME: How many colours is that?
HIM: 65000

ME: From ... ? (I knew the answer, but still)
HIM: Unlimited.

ME: *Unlimited*??? It can't possibly be unlimited. Unlimited implies an infinite number of bits
HIM: <speechless> (someone else overhearing the conversation nearby started to giggle)

ME: You mean from 256000 colours. That's not *unlimited*, it's just very large.
HIM: <sorta nods in agreement>

ME: I hear that it's got a built-in genlock
HIM: Yes

ME: You mean no external hardware is required? I can just plug in incoming video?
HIM: No, you need external hardware.

ME: Then it's not built-in. You mean it has genlockable modes.
HIM: <sorta nods in agreement>

At this point, I started to pity him. I started to ask him about the sound capabilities, but one of his colleagues came over and interjected on his behalf. This guy looked quite unfriendly. He affirmed, with a sense of finality, that the Falcon still uses the same 8-bit sound chip as in the STe, and 8-channel 16-bit audio is possible only through the DSP. I decided to say goodbye at this point, and picked up some of the literature being given out. It says in there that the Falcon is incompatible with the STe, and that Atari is confident of selling 20,000 this year (worldwide or in the UK?). As for software availability, it mentions forthcoming stuff like D2HD recording and conferencing software that uses the DSP. Atari is leaving no doubts, however, that this machine is being aimed squarely at the consumer market.

Verdict: The Falcon is an Ape - you know, imitate everyone. A bizarre cocktail (pun intended:) of a machine whose hardware is a combination of features inspired mainly by the Amiga and the NeXT, plus a few others. For instance:

The colour palettes and resolutions are very much SVGA-like (8/15/16-bit colour from an 18-bit palette). The 32K/65K "TrueColor" modes remind one of some of the cards you can get to run Windows in.
Overscanning, interlacing, genlocking - wonder where they got those from!! Around the time of the launch of the TT, Sam Tramiel was interviewed by a magazine, and he criticised the Amiga 3000 for its flicker. Now he builds a machine with interlace.
Mucho NeXT emulation in things like their choice of DSP, the SCSI-2

port, the black colour of the case. Even things like BLiTTER and MiNT are dead giveaways. Again, in the aforementioned interview, Sam was quoted as saying that he hoped that the TT would "clobber" the NeXT. Imitation is the sincerest form of plagiarism....
That built-in LocalTalk networking port appeared very similar to

AppleTalk ports you find on any Mac

I don't mean to incubate :) another Falcon flame war here, so any Atari fans reading this please note that the above does not include anything other than raw facts. I will, however, say the following (mainly because it is too difficult to resist:):

"Amiga - the computer for the creative mind"
"Falcon - the computer for birdbrains"

:):):):

Once again, Mr. Kovarski has been spouting off about things he doesn't know about. The Atari ABC clone line originally started back in 1987 - shortly after that, they were discountinued, and sold abroad. More recently, Atari introduced a new ABC line with a 386SX, a 40Mhz 386, and a 386Notebook - these were also sold in America, but for a much longer time period. I have heard rumors that they have been discountinued, but i could buy one anytime I wanted to - they really have a nice case. At any rate, Atari has no say in the manufacture and design of these computers - a manufacturer pays Atari to use it's name......

Greetings,

Question: Are the various scanners available for the Atari ST hardware specific, or can one suitable for an Amiga be used with the correct software?

The reason is, I see many handscanners and so forth for sale in the local trading post, but they are advertised as suitable for Amiga'a. I'd like to purchase one of these if they can be used with little or no modification as they are very reasonable priced.

If the answer is yes, is Touch-Up suitable software...

All answers appreciated...

Some of us *like* to be able to have filenames longer than the limiting 8.3
size... And UNIXMODE had nothing to do with the difficulty in getting
GnuEmacs 18.58 to work - it was the directory names with '-' in them
(e-lisp, e-bin, etc...) that caused all of the bother (although you still
have to have UNIXMODE set to install after that).

Actually, I'd go so far as to wish UNIXMODE was built into the operating
system - a fair tradeoff between compatibility to/from MS-DOS systems.

It's the only thing I really like from the Mac that I wish was on the ST...

>Len

Len,

I'm not so sure about the part of Jack not being in control of Commodore. If you read a book called "The Home Computer Wars", you get some excellent insight into how Jack thinks and runs a company. The references in the book to the "Jack Attack" leaves me with the impression that although others were running different parts of Commodore, if they were doing something that Jack didn't like, they got a verbal beating. But, I want to be careful when I say all this, it's been a while since I've felt nostalgic enough to pick up the book and devote time to reading it again. I don't know anything about how Jack runs Atari internally, there haven't been any books about him while there. Maybe, because the Atari rotating door doesn't allow anyone to be as close to Jack to really get an idea what he's about these days. Straining in memory, perhaps Jack did leave things more to others... people who weren't Tramiels.

I also think the markets then and now are totally different. Commodore VIC 20's and Atari 800's were out before the invasion of PC compatibles. Now, it seems cool to have a business PC at home, instead of a well rounded computer that the whole family can enjoy. For me, you look at a PC, and it doesn't say family. Look at the old Atari and Commodore machines.

THey had nice graphics, nice sound, were easy to use, and everything was pretty much plug and play. You bought a computer, disk drive, maybe a printer, and plugged the thing into your TV and away you went.

Today, you have to worry about processor type, processor speed, weird buzzwords like Cache, wait states, bus speed, you have to decide which operating system you want to run, you want sound? Gotta get a sound card.

It's pretty scary. I mean, sure people are expected to be computer literate these days, but computing just doesn't seem fun anymore. Back then, your computer was to play games, teach the kids, manage the family finances, keep a recipe book, print some posters for your local club. Today, if you buy into the PC business GEEK philosophy, your machine isn't for farting around, as much as it's meant to drag your work home with you so you can make your boss happy. That's no fun, it's turned your den into an extension of your office!

I think Jack still thinks the old way, while most of the computer community has bought into the idea that a computer is for business, it isn't a home computer, it's a personal computer, which sounds more impersonal to me than ever. People, in my opinion, have gotten too serious about computers. Nobody is happy with what works, it's always gotta be bigger, faster, better, when the average joe doesn't really need a supercomputer on his desk. He thinks he does, because Intel and Bill Gates has told everyone that they do. But they really don't.

Sure, there are those who do need all that power, but not everyone is a power computer user. Everybody seems to think they have to be, but I feel it's silly. That's why Jack put out the Falcon030 with a 16mHz speed. It's not supposed to be a NeXT workstation, it's supposed to be a home computer. A nice, well rounded machine, something that doesn't scare the heck out of the average buyer. You take it home, plug it in, and away you go. Everything the average Joe needs in already in the machine. Hard drive, graphics, sound. It's all there. no decisions to make, no needing a COMPUTERese to English dictionary to understand what extras are needed to make the computer work. You take it home{, unpack it, and load your software.
But see, people don't seem to be happy with that, because they think the machine needs to be more than that.
Intel regurgitates this vomitous philosophy that your computer has to be expandable, and capable of running your own Star Wars Defense system, or it isn't worth a darn. I don't believe it.

WHen I want to serious stuff, I go to school, and use expensive, serious computers. I run circuit analysis programs on a SUN, and do all my heavy duty lab reports, Mathematica number crunching, CAD stuff, on a Next. When I want to enjoy myself, I come home and use my Atari. It's simple.

I don't think there is a whole heck of a lot wrong with the Falcon030 if you just take a different approach in determining how it's supposed to be used for most things. It's a consumer appliance, not a business PC, or workstation. It shouldn't cost as much as a used car, a home appliance computer should be cost comparative with other

home appliances, like your dish wasther, television, and VCR.

Just my two cents worth. I feel like a candidate in a debate,
"Mr. Perot, your time limit has long expired...."

Jeff McWilliams

When I hook my replay cartridge up to my mixer board, I get radio pickup immediately. (With the computer off) I am using gold plated patch cords so I am sure it has nothing to with the cords, and I have had no trouble with the mixer board in the past with radio pickup.

Ignoring the radio, the samples sound pretty good, but I can't use this as a real sampler if I get radio in the backround. How can I fix it? What could be the problem?

When I hook a portable CD player to the mixer board, I get no noise when the cd player is on pause. None at all. What's up?

4121. I have uploaded STZIP20.lzh to A.A.

Message-ID: <1992Oct16.021536.10582@uoft02.utoledo.edu>
Source record: 216283

hmm. i don't see why Atari should be criticized for building a computer
that has many of the same features found in other computers. actually,
this is a bonus.

i -like- the idea that i can use SCSI II devices. i -like- having
a fairly standard DSP. i -like- having standard Localtalk. (not
as good as ethernet, but hey...) you mention ripping off NeXT by
using a black case. is the Falcon black? all the reports i've
seen have said grey, but if it's black i'll buy one right away!
(i even painted my Amiga 500 black.)

as far as video modes, interlace is good for doing video (which
is interlaced), but notice that you can do all those modes non-
interlaced if you have a better monitor. i like the fact that Atari
is making it easier for those of us who can't afford expensive
displays. this way i can use my trusty 1084S, which also does
double duty as a VCR monitor.

i had asked earlier about the color depth on the Falcon & got
the response that it was a 15/16 bit display out of a 16 bit
pal. you say 18 bits. sorry, but you're making me -like-
the Falcon even more. :^)

is the fact that the new sound can only be accessed through
the DSP supposed to be bad? the point is that it -has- a DSP
standard, so all new programs will probably end up using it.
the old chip is there for compatibility, as well as boring
stuff like system bells. (tho the DSP will make those more
interesting as well.)

this isn't a flame. i just find it amusing that you post an
article that supposedly bashes the Falcon & ends up making
me want one more than ever!

4126. First Falcon030 impressions

Newsgroup: comp.sys.atari.st
Date: 1992-10-16 09:04:09 UTC
From: wmagro@uiuc.edu
Message-ID: <Bw7Ily.Eu3@news.cso.uiuc.edu>
Source record: 216284

WHAT FOLLOWS IS AN EXAUSTIVE REPORT OF MY FIRST HAND DEALINGS WITH A FALCON030. MOVE ON IF YOU DON'T LIKE LONG POSTS!

Well, I got my hands on a Falcon030 which I get to keep for two days, so I stayed up until 6am, and ran it through all the tests I could think of. I set it up next to my ST and ran some 'real world' benchmarcks against the ST. I tried all the software I could find (mostly PD and shareware and demoware, as I don't own much commercial stuff except games). I was able to borrow a copy of wordflair and of wordperfect from a friend, and I tried out our User Group's copy of PageStream.

We first hooked it up to a SC1224 through the 'ST Monitor Adaptor Block.' This plug converts the 19 pin monitor out (which is a non-standard pinout) to either an SM124 or SC1224 (or other ST monitors). We were able to do 640x4?0 or so interlaced (which is icky) in true color. The machine has a nice slide show program which was displaying TARGA 24bit files (in 16 bits) in interesting ways. Nice scrolling and unrolling and fade effects were used to move from picture to picture. I think the machine was in 320x200 true color mode for these displays, but the picture was near photo quality.

You can see the slowdown of the machine when running the desktop in 640x4?0 true color, but the machine was still relatively quick. We were able to do all the modes (color and ST 640x480 mono) on the SC1224. The mono mode didn't look all that good, because of 'moiring' apparently due to the not-so-fine shadow mask on the SC1224.

The sound was impressive as advertised. There is a program called System Audio Manager (or SAM) which allows you to assign keys to all gem events. I put opening and closing file drawer sounds on my opening and closing windows. The internal speaker is really LOUD! I kept waking my wife up when the machine said 'Welcome to Atari Falcon oh-thirty' at startup. Unfortunately, the Sound control panel didn't save my volume preference correctly, so the volume was always set to 14 after a reboot.

The machine I am using is supposedly an 'engineering sample', with German keyboard and PAL RF modulator (so I couldn't use my TV). It is loaded, with the 65meg internal hard drive and 14Meg of RAM. I wanted to open it up to see how everything is laid out, but it isn't mine, so I didn't. The machine has an internal fan and the hard drive is quite quiet.

The external SCSI-II connector is a standard 50 pin mini 'Honda' connector, found on SUN and DEC and NeXT equipment. So, neither your current SCSI cable nor a Mac SCSI cable will work. Unfortunately these cables cost $250 from Sun and $80 from third party vendors. I happened to have an extra DEC cable at work, so I borrowed it for the night. I took

an extra Seagate ST577N 65 meg drive I have and formatted it with ICD utilities on my ST. I changed the address to SCSI 0 (the manual says your SCSI hard disks MUST be in order starting at zero), and booted the falcon. The memory test came up, the IDE driver recognized the internal drive and identified it as an ST9077A drive, the SCSI driver recognized my ST577N and printed its name, then said 'SCSI 1 not responding...' and booted the desktop. The drive came up fine, and I was able to try out various programs.

I first ran QuickIndex (which was on the internal drive) and got the following results:

Test Machine compared to
STe TT ST
==========
CPU Memory 471% 66% 471%
Register 402 49 402
Divide 504 49 504
Shifts 1737 49 1737
DMA 64k Read 3533 6099 3996 <-this test looks
wrong!
Gemdos files 3575 3575 3575

TOS Text 118 53 127
String 145 69 153
Scroll 158 59 210
GEM Dialog 130 72 186
==========

I have never used QuickIndex before, so I don't know whether these numbers seem reasonable. The DMA read certainly looks incorrect.

Next, I wanted to check out the new keyboard controller that is supposed to be quick enough for 300dpi mice. I plugged in my Golden Image 300dpi mouse and moved it quickly; the pointer still goes crazy on the screen. Evidently, this early machine does not have the new chip or the new chip still isn't fast enough for my mouse.

Other notes of interest: The machine was running the new TOS 4.01 with three dimensional buttons and 'animated' icons--icons change when you select them instead of inverting. Often, when I rebooted after a crash using control-alt-delete the machine would get confused and make LOUD repeating key click noises until I hit a key. The floppy activity light now lights when either the internal HD or the floppy is in use. I had no trouble reading and writing floppies from my ST or from an IBM. The case cutout for the 1.44 meg floppy is now rectangular, so drive swapouts should be easy. The machine was labeled as a german falcon, with german keyboard and 240 Volt input. I plugged it into a 120V outlet, though, and it worked fine. Either it has an autoswitching supply (like macs) or someone replaced the power supply with a US model. Support for all international keyboard layouts was in ROM. I was able to click on 'US' and have my keyboard mapped the QUERTY way instead of QUERTZ, which is how

the keys were labeled. I was disappointed that the keyboard is very similar to the original ST keyboard. It is slightly improved over the ST's 'mushy' feel, but it is a long way from the feel of sun/next/mac keyboards, which I prefer. The computer came with a 220 page user manual, which was extremely well written, considering Atari's flyers for the ST Book and MegaSTe which contain spelling and grammatical errors as well as typos (VERY unprofessional). It seems they hired a new, more careful technical writer. The manual is fairly complete and includes pinouts for all the back side ports except the television port. Surprisingly, there are no instructions for connecting a TV in the manual.

I have a multisync, but the machine did not come with the required 'VGA adaptor block', so I couldn't plug it in. I tried using my multisync->ST cable, but it didn't work. Some experimentation revealed that the problem was in the composite sync. The problem is in my multisync, not the falcon, I believe.

I only have an SM124 at home (which the Falcon handled perfectly), so all the following information applies to a Falcon030 running from an ST577N (~570k/sec) drive on the SCSI-II bus (except where noted), on a mono monitor. The other machine is a 1040STf TOS 1.4 with a sllooooww maxtor mfm drive (~370k/sec).

Here are programs that I tested that functioned correctly:
==========
Calamus 1.09 demo
AKS (a beer barrel warehouse game)
Freeze Dried Terminal
Invision Elite (demo) (cool startup screen went by so fast i couldn't see it)
Mono 'Shifter demo' (old demo. ran much faster than on my ST!, but hung the machine on the last bit)
Uniterm
Sticker3 diskette label program
Sudden View (demo) (wow! this one surprised me. It worked perfectly and was FAST!)
1st word
Infocom games
CAD 3D
PuzzlePuzzle puzzle game
Printmaster
Psion Chess
Megaroids (timing was still correct!)
Pagestream 2.2 (still painfully slow at four times faster than an ST!)
CSTeX
WordFlair

These programs failed (usually hanging the machine):
==========
Spectre 3.0 (didn't even make it to the main setup screen, handing after the 'Hard disks do not match saved info...' message.)

Redacteur (demo) (half works then hangs the machine)
Patience (solitaire cards)

I did various timings on the kinds of operations I do frequently: file copying, TeX, and archiving/unarchiving. I found some a few surprising results. In general the falcon was much faster at graphics (such as screen redraws) and comparable or slower in disk operations. The slow desktop copy time may be due to settings of the hard disk driver. The Falcon030 was using Atari Hard Disk Driver 6.0.3. I don't know whether a cache was enabled or not. On my ST I use ICD software with fairly large read and write caches. The slowness in the Falcon seemed to be due to FAT lookups on the nearly full 65 meg SCSI drive (one partition). Here are some tests and some timings:

Test Time in US units (I don't know metric)
Falcon030 ST TOS 1.4
==========
initex latexg.ini and dump 2:20 2:05
latexg.fmt file

latex atari.tex document from 1:30 1:55
CSTeX distribution

Copy CSTeX directory 30:00 7:15
(6.1 Meg in 714 files).
Falcon had 'fast' ST577N, ST had
'slow' mfm drive.

Scroll Calamus demo document 1:03 2:29
(with space shuttle graphic) from
top to bottom at 500% magnification.

Scroll same document a screen at a 0:08 0:19
time (using scroll bar) at 999%.

Both systems running MiNT: 0:45 0:51
zoo a paula.zoo paula/*

Still under MiNT:
zoo xp paula.zoo > /dev/null 0:07 0:13

Under MiNT, archive my whole MiNT 16:45 24:02
directory.
zoo a mint.zoo mint/*
==========

My overall impression of the machine is very positive. The all in one case design was not so annoying since the hard drive was internal. I would still prefer a separate keyboard with a better feel. It is a shame the machine isn't black (but grey). A friend of mine says that there is a law/rule in Germany against buying black computers with state funds. It sounds pretty far-fetched that would be true, but if so, that might explain the abandoning of the black case.

I am sure that the hard drive speed could be improved with the right sofware. Overall the machine feels quite snappy. I will have a hard time going back to my ST tomorrow. The sound improvements are wonderful, but of limited usefulness to the average user. They will make games amazing though. The biggest improvement is in the graphics modes and the new 3D buttons on the desktop. Otherwise, it's just a quicker ST.

I will happily buy one of these for $800. I was hoping for something closer to a four times speed improvement instead of the two to three times improvement I observed. But any extra speed and expanded memory are enough to please me.

I hope my long long long post wasn't too much. If the length bothered you please tell me in e-mail. Any other questions are welcome, as well.

>I reckon you can't really expect much more than this.

>Simon.

>>>> A truly wise man never plays leapfrog with a unicorn <<<
I was that angry poster to which you refer. You got that particular bug fix
only after *I* had spent a very long time on the phone trying to convince
WT that there was a bug, and had to send off test files, printouts etc.
Finally, he admitted there was a bug, and (for this bug, but not for
others) sent a fix. I would like to see you trying to convince
Mr Johnstone (WT) of any bugs that haven't already been proved to him.

Now you're using FlexText, you will notice that, even though your PostScript
printer has Times-Roman and Helvetica built-in, and you have stated this
in your Postscript PAK font map, Calligrapher does NOT use the built-in
fonts. Instead it renders FlexText characters itself. Apart from generating
unneccessarily large PostScript files, you will notice that the chars
are VERY badly rendered. How smooth do the outlines of O, e etc letters
look? When you complain to Johnstone he will first say that it's a bug
in the PostScript interpreter, rendering line joins incorrectly. Then,
when you prove him wrong on this, and prove beyond even his doubt that
the outlines are wrong because Calligrapher used incorrect coordinates
for some of the points on the outline, he will say tough, he's not going
to fix it anyway.

If you get the same version of the PostScript driver that I've got, also watch out for apostrophes coming out as cent characters (I've fixed this by patching the driver). Watch out for inaccurately drawn rounded boxes. Watch out for fill patterns being drawn at 72dpi even on a pro typesetter. And have a good laugh trying to print a copyright or Registered Trade Mark character using either Times-Roman (Holland) or Helvetica (Zurich).

Obviously, some of the bugs listed in the last paragraph are minor, but the incorrect character outlines is FUNDAMENTAL.

I have had private E-mail from other Calligrapher users who have suffered the same lack of support as me.

Source record: 216293
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

So now I have to ask the question, does the Falcon040 have an internal IDE interface and will it take the cheaper 3.5" drives???

I think I'll probably be better to buy an external SCSI-2 for the extra money and faster access times than mess around trying to find a 2.5" IDE drive of 100Mb capacity!

An internal 64Mb IDE drive can just sod off for that price, the falcon isn't a laptop portable thingy. A slightly bigger case and cheaper HD expansion would have made my day.

Hrrummmphhh!

I'm sure you get the gist of my disappointment.

-Andrew.

From: richard@star.ic.ac.uk
Message-ID: <1992Oct16.111315.6181@sol.ctr.columbia.edu>
Source record: 216287

I've gone and ditched all the previous postings about this, so I'll try to pick up the thread...

I got choas yesterday, and this msa thing, and farted about getting an 11 sector disk. Fine.
I've got a 2 meg ste, so I loaded the chaos?.msa and newmas.prg onto a ramdisk. On the first attempt msa wrote 31 or so tracks out of the first file and decided it wasn't going to do any more. I just ran it again and it worked though (strange ...) If you're having problems with it, just keep on trying and maybe it'll decide to work.
I don't understand why this program was used to archive chaos, as far as I can see the only thing in it's favour is that it formats the disks for you as it unarchives... but not if they've got eleven sector tracks :-(I think it would have been more sensible to use something like zoo which can unpack things into the correct subdirectories and includes a decent compression algorithm. I would have rearchived chaos myself infact if I wasn't too busy last night playing it :-) Wicked game...

Richard

Well, you talk about documentation. Here is an updated extract from the installation section of the file gcc-st.txi, which should be available from a.a.

Tell me, if you can get GCC run with this info or not. If you can not, then tell me why (bad english, bad grammar). I'm gratefull for every hint.

```
============================================================
Installing GCC
***************
```

There are basically three components, which make up a basic compiling system and which have to be installed. Each component is accessed via an environment variable. This three components are:

The executables
These are accessed via the normal `PATH' variable, by which all other programs are found and the variable `GCCEXEC'.

The header files
The preprocessor accesses the header files via the variable `GNUINC'. Any C++ header files are accessed via `GXXINC'

The libraries
The linker finds the startup file and the required libraries via the variable `GNULIB'. The C++ library also belongs into this directory.

All this stuff basically assumes that you're using a CLI (command line interpreter). A really good choice is Gulam, which has very nice set of features, but there are quite a number of other CLI's around,

which also might do the job. If want as much U**x feeling as possible, you might consider either `ash', which is compatible to the Bourne shell (ported by Stefan Neuhaus), or E.R.Smiths port of `tcsh' or Scott Kolodzieskis port of BASH 1.12.

Apart from the CLI you definitely should get yourself a make utility. Again, good choices here are either the GNU Make, which offers nearly the complete U**x make functionality on the ST or the PDMAKE, which has only the core make functionality, but has on the other hand the advantage, that it requieres fewer system resources.

I suggest the following directory structure on your disk partition:

`\gnu\bin'
for all executable programs. The compiler driver finds the executables in this directory by looking up the environment variable `GCCEXEC'.

`\gnu\lib'
for the startup object modules and the libraries. The linker find the startup code and the libraries in this directory by looking up the variable `GNULIB'.

`\gnu\include'
for the header files. The preprocessor finds the include file in this directory by looking up the environment variable `GNUINC'.

With earlier versions of GNU CC it was only allowed to put one path into the variables `GNULIB' and `GNUINC'. GCC 1.37 and later allows you to put several paths into these variables, which are separated by either a `,' or a `;'. All the mentioned paths are searched in order to locate a specific file. However the startup module `crt0.o' is *only* looked for in the first directory specified in `GNULIB'. If the preprocessor can't find a include file in one of the directories specified by `GNUINC', it will also search the paths listed in `GNULIB'.

Installing the Executables
==========================

The compressed archive of the GNU C compiler binary distribution contains the 'common' executables of the GNU compiler. That means the compiler driver (`gcc.ttp'), the preprocessor (`gcc-cpp.ttp'), the main body (`gcc-cc1.ttp'), the assembler (`gcc-as.ttp') and the linker (`gcc-ld.ttp'), but depending from where you got your GCC the packaging might be different. The just mentioned programs are the absolute minimum. To be comfortable, you should get the following support programs:

`gcc-ar.ttp'
is the object library maintainer.

`gdb.ttp'
is the GNU debugger 2.6 modified for the Atari ST. John Dunning

did the original port to the Atari. Since then Jwahar Bammi has extensively hacked it. GDB now uses DBX debugging information in the object files. This requires an assembler with version 1.36 or greater.

`sym-ld.ttp'
creates the symbol file needed with GDB.

`gcc-nm.ttp'
prints the symbols of a GNU object library or an object file.

`cnm.ttp'
prints the symbol table of a GEMDOS executable.

`fixstk.ttp'
`printstk.ttp'
are used to modify and print the current stack size of an executable.

`toglclr.ttp'
TOS 1.4 users can toggle the clear above BSS to end of TPA flag for the GEMDOS loader. A newer version of `toglclr.ttp' also allows to toggle the loader bits, that were introduced with TOS versions 2.x and 3.x.

`size68.ttp'
This program list the values of the TEXT, DATA, and BSS sections of a ready to run executable.

`xstrip.ttp'
removes the symbol table from an executable.

All this files should go in `\gnu\bin\' directory on your gnu disk. I personally keep my executables in the directory `e:\gnu\bin'. You should than extend the search path of your CLI to include this directory or you move the compiler driver `gcc.ttp' and the files, which are *not* invoked by `gcc.ttp' (`gcc.ttp' calls `gcc-cpp.ttp', `gcc-cc1.ttp', `gcc-as.ttp' and `gcc-ld.ttp') into the directory, where you keep your other executables. The next step is to actually define `GCCEXEC'. `gcc.ttp' uses this variable to locate the preprocessor, compiler, assembler and the linker. `GCCEXEC' contains a device/dir/partial-pathname, which not only consists of the directory, where the executables are kept, but also a common prefix, which is `gcc-'. Assuming you also put the executables in the directory as described above, `GCCEXEC' would contain `e:\gnu\bin\gcc-'. The value is the same, you would give the compiler driver with the `-B' option.

Then you should define a variable called `TEMP'. During compilation the output of the various intermediate stages is kept here. The variable must *not* contain a trailing backslash. If you have enough memory, `TEMP' should point to a ramdisk.

Installing the libraries
========================

The next thing to do is to install the libraries. The distributed
archive contains the following libraries (again, the packaging may
vary):

`crt0.o'
`gcrt0.o'
are the startup object modules. The file `gcrt0.o' instead of
`crt0.o' is used, if the sources files are compiled for execution
profiling (the `-pg' option).

`gnu.olb'
`gnu16.olb'
are the standard libraries, the usual `libc' on other systems.

`curses.olb'
`curses16.olb'
are ports of the BSD curses.

`gem.olb'
`gem16.olb'
contain the Atari ST Aes/Vdi/FSM-GDOS bindings.

`iio.olb'
`iio16.olb'
contain the integer only `printf' and `scanf' functions.

`pml.olb'
`pml16.olb'
are the portable math libraries.

`termcap.olb'
`termcap16.olb'
are for the pure `termcap' support.

`widget.olb'
`widget16.olb'
are a small widget based on `curses'

All these libraries go to a place described by the environment
variable `GNULIB'. Again this variable must *not* contain a trailing
backslash. Staying with the above example, I've set the variable to
`e:\gnu\lib'. The libraries, which have a 16 in their names were
compiled with the `-mshort' option. This makes integers the same size
as shorts.

If you like to write programs for MiNT, the TOS multitasking
extension from E.R.Smith, you might consider to replace `gnu.olb',
`gnu16.olb', `iio.olb' and `iio16.olb' with the libraries supplied by
Eric Smith. The source and the binaries of these libraries can also be
retrieved from the Atari archive at terminator. The files are
`mntlibXX.zoo' for the sources and `mntolbXX.zoo' for the binaries.
They are found in the `mint' directory. XX is the version number,

currently 20. Programs written with this libraries will also run under TOS, as long no MiNT specific features have been used. (*Note The C-Compiler Driver::, for more info on compiling programs for MiNT (the `-mint' option))

Another option is to have both sets of libraries installed. For this you have to rename the MiNT libraries according to the following scheme:

* `crt0.o' => `mcrt0.o'

* `gcrt0.o' => `mgcrt0.o'

* `gnu.olb' => `mint.olb'

* `gnu16.olb' => `mint16.olb'

To select these files instead of the standard TOS versions and to activate the MiNT specific portions of the header files you have to include the `-mint' option in the `gcc.ttp' command line.

Installing the Header Files
===========================

The last bit to install are the header files. They are contained in an archive of their own. The preprocessor now knows about the variable `GNUINC'. Earlier version had to use the `-IPREFIX' option, to get to the header files. According to the above examples, the files would be put in the directory `e:\gnu\include'. `GNUINC' has to be set accordingly.

If you like to write programs for MiNT, apart from the libraries you also need the MiNT specific include files (also from the Atari archive). These are found in the archive `mntincXX.zoo' in the `mint' directory. XX matches the version number of the library. (*Note The C-Compiler Driver::, for more info on compiling programs for MiNT (the `-mint' option)).

If you choose to have both sets of libraries installed you can keep the TOS specific header files since they are compatible with the MiNT ones.

Gulam Notes
===========

The programs, which come with the GCC distribution also understand filenames, which use the slash (`/') as a separator. When Gulam is your favorite CLI you will stick to the backslashes, since you otherwise lose the feature of command line completition.

If you are using Gulam, you can define `aliases' to reach the executables under more common names.

```
alias cc e:\gnu\bin\gcc.ttp
alias ar e:\gnu\bin\gcc-ar.ttp
alias as e:\gnu\bin\gcc-as.ttp
```

```
alias ld e:\gnu\bin\gcc-ld.ttp
...
```

Now you should be able to say `cc foo.c -o foo.ttp' and the obvious thing should happen. If you still have trouble, compare your settings with the ones from the sample file `gulam.g'. That should give you the right idea.

One additional note to Gulam. `crt0.o' is currently set up to understand the MWC/Atari convention of passing long command lines (except it doesn't look into the `_io_vector' part). Gulam users should set `env_style mw', if you want to give long args lines to `gcc.ttp'.

To summarize the above, here are the settings from my `gulam.g' initialization file. The usage of `UNIXMODE' environment variable is explained in the file `unixmode.doc', which is part of the library sources. The `GXXINC' variable is for G++.

```
set env_style mw
setenv TEMP i:
setenv PATH e:\gnu\bin;<your other search paths here>
setenv GCCEXEC e:\gnu\bin\gcc-
setenv GNULIB e:\gnu\lib
setenv GNUINC e:\gnu\include
setenv GXXINC e:\gnu\g++-inc
setenv UNIXMODE 'd/brG'
```

Installing G++
****

For the G++ installation apply the same rules as for the GCC installation. The G++ compiler driver `g++.ttp' and the actual compiler `gcc-cc1+.ttp' belong into the same directory as the GCC executables. The preprocessor is shared between G++ and GCC. The library `g++.olb' goes into the same directory as all the other libraries. Since G++ has a complete set of include files of it's own, they all should be copied into the directory `\gnu\g++-inc'. To let the preprocessor know, where it can find the include files, the variable `GXXINC' is used.

The above is valid for G++ 1.xx. Since GCC and G++ were merge into one large package with version 2.x, there is no longer a special compiler driver for G++. `gcc.ttp' determines from the file extension, whether the C or C++ compiler should be invoked. The file `gcc-cc1plus.ttp' is the actual C++ compiler. This file name is usually truncated to `gcc-cc1p.ttp' in the 8+3 TOS file system. What is said about the include files and the variable `GXXINC' is also true for G++ 2.x.

To actually use G++, some requirements have to be fulfilled. You need the GCC include files and libraries with at least patch level 72. Additionally the linker `gcc-ld.ttp' must have at least patch level 22.

The library `g++.olb' is at the moment not 100% 16bit clean. That means, there is at the moment no version, which is compiled with the `-mshort' option.

Memory Requirements
****

GCC loves memory. A lot. It loves to cons structures. Lots of them. Earlier versions probably won't run at all in less than 1 Meg; the version 1.36 of GCC will probably need 2 Meg. The `gcc-cc1.ttp' had 1/2 meg stack, and needs it for compiling large files with optimization turned on. Happily, it doesn't need all that stack for smaller files, or even big files without the `-O' option, so it should be feasible to make a compiler with a smaller stack (with `fixstk.ttp').

GCC versions 1.37 and later uses another scheme for memory allocation. The programs `gcc-cpp.ttp' and `gcc-cc1.ttp' are setup for `_stksize == -1L'. This means, that an executable will use all available memory, doing mallocs from internal heap (as opposed to the system heap via `Malloc'), with `SP' initially set at the top, and heap starting just above the `BSS'. So if the compiler runs out of memory, you probably need more memory (or get rid of accessories, tsr's etc and try).

During my compilation of TeX 3.1 on my ST, I found that the size of a source file is not main the limiting factor, but the size of a function. At that time my ST was equipped with 2.5 megs of memory. About 512 Kb was used for ramdisk, cache and some auto folder programs. With this configuration the maximum size of a function, which could be compiled, was about 14-20 KB depending on how much code was inlined. Additionally I was able to compile GCC 1.40 and GAS 1.38 on my ST, but for this I had nearly disable every program in the auto folder. So, with GCC 1.40 you're doing fine with at least 2.5 megs.

With GCC 2.2 you definitly need more memory. The compiler executable itself is about 850 Kb in size. The C++ compiler is even larger (about 1.1 Mb). So, with GCC 2.2 you should have 4 Mb.

4133. Re: HELP! How do I do a batch LHarc with a CLI?

Newsgroup: comp.sys.atari.st
Date: 1992-10-16 12:15:16 UTC
From: sanfrids@e.kth.se
Message-ID: <009622DD.7B660A00@e.kth.se>
Source record: 216291

You don't need a cli to pack in .lzh format. Just issue C *.mod to pack your modfiles if you have LHarc 2.01 by Thomas Quester. You can then put AFX.PRG in your AUTO-folder and have instant access to all packed files.

The filenames will be the same. Very practial, I use it to pack my Calamus fonts and it saves a lot of space on my harddisk.

4134. Degas Fonts or .FED Fonts

Newsgroup: comp.sys.atari.st
Date: 1992-10-16 13:08:31 UTC
From: cs2320ak@utagraph.uta.edu
Message-ID: <1992Oct16.130831.13507@utagraph.uta.edu>
Source record: 216292

I have the file FONTRX2 which reads Degas and Atari 8-bit fonts, and I have a .FED font loader. I have a few fonts for these programs but I would like to have more. If someone could point me in the right direction or if you have some, I'd love to get some more. I have looked on a.a but there isn't much in the was of Degas or .FED fonts there. If there is a program which will convert between font types, that would be good also. Thanks.

4135. Re: FALCON ? READ THIS !!!

Newsgroup: comp.sys.atari.st
Date: 1992-10-16 13:53:27 UTC
From: chu@acsu.buffalo.edu
Message-ID: <Bw7vx3.Dnw@acsu.buffalo.edu>
Source record: 216294

It seems to me that all this guy proved was that he knew more about the Falcon than the guy he was quizzing. While that's regrettable and somewhat unprofessional of Atari, that says nothing about the quality of the machine.

After reading this article, I just have one question:

Can someone explain to me why the author of the article seems to feel that the Falcon is not a very good machine because it has features that other computers have (to use his words, "The Falcon is an Ape")?

Does this mean the Amiga and the ST are also not very good machines because they followed the Mac's lead in having a graphical user interface? (Of course, to extend this further, Apple "paid homage" to Xerox.) So if the NeXT is considered a good machine, any machine that has DSP and a GUI should automatically be looked on disparagingly?

Were the 2nd generation Amigas bad computers because Commodore decided to give them an "ST-style" (:-)) numeric keypad? :-) :-)

Of course not. Having a numeric keypad is generally considered an improvement.

(My Amiga history isn't that great. But if I remember correctly, the first Amiga keyboards didn't have a numeric keypad, but later ones did, in the "standard" (i.e., VT terminal, PC keyboard) layout.)

Frankly, I don't understand why he characterized the Falcon in the negative manner for having features that people want. It seems to me that the computer industry evolves exactly by this process. First, the expensive machines have some feature and eventually it becomes available on some machine at a lower price point.

So, will some one please explain (if you're going to be inflammatory, please use e-mail) why this is such a bad thing?

john

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse ......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I will only sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it.

PRICE: $600.00 w/o Printer
$650.00 with Panasonic printer. Sorry, I don't remember the
model number. It is Epson compatible however. Hardly
used.

THE ALESIS HAS BEEN SOLD...THANKS TO ALL THAT INQUIRED......

I doubt that MultiTOS is really going to make the GCC the most popular
compiler, because it takes a lot of memory and such. Pure C will be far more
convenient, both more convenient than GCC and more convenient than the way it
works now: in the future you will be able to use your own editor without any
problems (as long as you don't mix with the built-in editor).

: (E-mail naffara@uk.ac.crc)

I'm not sure, but I think that you will need a disk formatted to
11 sectors per track before you unpack that .MSA archive, since
the MSA program itself seems to be unable to do that itself. So
you will have to use eg. Hypercopy or a similar program to do
that.

From: botfield@turtle1.Berkeley.EDU
Message-ID: <1992Oct16.155650.12956@rtsg.mot.com>
Source record: 216120

I am the proud owner of a 220 volt 520 ST. This system includes 2 floppies runing off a separate power supply, and an Atari monotor. (note that the computer itself has an external power supply). The whole lot was bought in the UK a few years back. Now I live in the USA, and would like to use the system, rather than buy a new one.

So I'm interested to know just how easy a power conversion is. Has anyone attempted this sort of thing? An Atari dealer told me that the keyboard is timed off the AC cycle which is 50Hz in Britain. But in the USA, the current frequency is 60Hz. How do I go about handling this subtle problem?

As you might have guessed, I am not exactly fluent in the electrical/ electronics area, but I'm ok with a soldering iron!

Regards,

Derek

Using a VCR as a tape streamer doesn't seem to be a novel idea. Last
week, I finally threw away some German magazines from 1986. One of the
issues had an ad for this very same thing.

It would appear that an analog videotape is not well suited for storing
digital data. Otherwise, it would surely have caught on.

Thanks for the quick review of the Falcon. Looking at the list of programs you tried, you need to get more mainstream ST applications -- other than TEX. :^)

Have you ever used a Mega STE or TT keyboard?

And a comment about the mouse control, perhaps the problem with the strange movement of the mouse is due to the Golden Image mouse itself and not the Falcon. I have one sitting here on my other ST and I've never liked the mouse. Yes, yes, I know how many people out there just love it, but I think it's substandard. I'm one of those people who loves the regular ST mouse. The main reason I don't like the GI is that when you move it quickly, which I seem to do often, it skips, which I find very annoying. Anyway, enough of the mouse rambling.... :^)

Thanks again for the report. BTW, how did you manage to borrow the Falcon?

Not exactly related, but has anyone had any problems with very large ZIP
files? i think there may be a limit on either the number of files in an archive
, or the size. When i try to compress my message base (probably 1500+ files
in 10+Mb) i _always_ get a corrupt ZIP. i don't have this problem with more
'normal' sized archives.

Adam.

4154. Gulam in 50 line mode?

Newsgroup: comp.sys.atari.st
Date: 1992-10-16 19:50:41 UTC
From: "J.J. Lehett" <JJL101@psuvm.psu.edu>
Message-ID: <92290.155041JJL101@psuvm.psu.edu>
Source record: 216102

Is it possible to kick Gulam into a 50 line mode somehow? I know I tried
the MASTER shell, and it has a 50 line mode, and if I leave that shell and
go into gulam it retains the 50 lines, however is there a simple prog out there
anywhere that does this same sort of thing, (it even retained it for
displaying text files on the desktop).

>

>As far as I know, IDE drives are not that cheaper than SCSI ones.

The difference might not be large, but there certainly are a difference.
Another reason to go for IDE just came to my mind: availability! The
2.5" IDE drives are used in most notebook computers, and i do not
know of any using 2.5" SCSI drives.

>I can't believe the difference is significant enough to cover the extra cost
>of developing the IDE internal interface !

Well, the IDE interface was developed for the ST-Book, so it was no extra cost
in the Falcon project i guess. I've not seen the schematics of the Falcon and
the ST-Book, but the IDE interface is probably only a extra PAL working
together with the blitterchip. After all IDE isn't that a complex buss.

It's a game console. It was first reported in an issue of "EGM" two years ago. It is by Atari but you know what, IT DOESN'T EXIST! Yes, it doesn't unless someone has seen one. It is one of the MANY rumours you hear from Atari camp.

If you want a console, there are two choices: Genesis and Super Nintendo aka Mega Drive and Super Famicom. The two are the leading game consoles on the market.

4159. Re: Jack - from Commodore to Atari

Newsgroup: comp.sys.atari.st

>>How is it that Jack Tramael(?) managed to be so successful with the C-64
>>and Commodore and yet can't repeat that success with Atari?

Well, the entire ST/Macintosh/Amiga platforms were 16-bit computers, and they certainly were superior to the previous 8-bit platforms from Atari/Commodore/Apple and the entire IBM PC platform (an 8086 was an 8-bit processor trying to emulate/work like at 16-bit processor).

The problem was this: most people had finally gotten into computers, the 8-bits. The US market was developing, and the new 16-bit computers had to compete not only amongst themselves, but with the older 8-bits which still existed in a vigorous (and cheaper) portion of the market. You needed a more sophisticated consumer to research the new technology (the 16-bits) and spend more money for it rather than go with a well established 8-bit market that an Atari exec once characterised as so cheap in price as to be an "impulsive" buy! There was no consumer brand loyalty as well as a lot of new consumers in the market.

>My analysis has been that the Tramiels planned on the "demise" of the ST in
>the US. I don't think they planned this from the beginning in 1985, ...

I agree, but for different reasons: the market I described above was the US in the mid to late 80s. Europe was a new and underdeveloped computer market at this time. Atari and Commodore aggessively went into Europe with the 16-bits and succeeded in capturing significant portions of that new market. Their computers were much cheaper and just as powerful (if not moreso) as the Macs and IBMs: they were positioned perfectly. Atari shifted its focus to Europe because it was a profitable and expanding market with less competition than the US market. Production quantities of the ST went to Europe, it had priority over the US market, which had begun to shrink for Atari. In reality, the ST market died in the US. What little attention Atari did have in the US was probably spent on production and development of the STacy/TT/STe/Mega STe/Lynx. The Jaguar/Panther, ST Book, and Falcon R&D are more 90's work than the 80's. Atari supposedly also has done research in pen computing, but we're not seeing any of that now. In short, Atari gave up on the ST in the US only.

The Falcon and Atari now? Why bother to speculate, we'll see very shortly how things develop. I do think Atari is doing things better so far. But I'm going to wait for the next Falcon platform release and observe the software/hardware base develop before I commit money into the computer market again.

>marketing it in the US is its screen resolutions. They can't compare with

That's total bull! What, people buy a computer JUST because of the resolution?
Users want support, distributed dealer networks, and much more. Atari didn't
provide it hence users become discouraged and move on.

Mr. Krimen, how do you explain the fact that Atari Canada, when it existed,
was running a Bulletin Board System on a *PC* and PC based software? You
should know, and I know, that their prime objective is to sell Atari
ST/(M)ST(E),TT computers thus they should have shown support by running it
on a ST/(M)ST(E)/TT *WITH* Atari 68000 based code. If the company doesn't
support their own computers, why should a user?

What do you smoke during the day? The Falcon is an enchanced ST but certainly offers some very interesting features to some people. As far as "doing better" goes, may I remind you that Atari's dividends/share in 1985 were $0.00 and the book value/share was $0.60. If you look at the stats, you should notice that the sales declined from 1987 on. According to Forbes, one of the most respected business publications in the world, Atari has only 20 million to present their Falcon, which is obviously not enough. It doesn't help matters that some publications put a D as the grade for Atari Corporation. What does a D mean? To put it very simply, DON'T invest in this company.

I am not surprised to see such a message from you, the contributing Editor for AEO, a biased magazines that tells people *ONLY* what Atari Corp. likes to hear. When are you and your publication going to talk about the real real issues that concern the users and stop practicing mindless cheerleading?

Sincerely,
Mark K.

>Don't forget: Turbo C generates good code from ground up. So that
>it feels it doesn't need an optimiser. But sometimes a good optimiser
>can make you win some time (and some place).

Something else to keep in mind is the style of C written. C programmers who aren't familiar with the assembly code of the target machine are more likely to need a good optimiser than those who do. If you want an example, try writing a function in Pure C, then trace the function through in the debugger in assembly. If you know assembly, you can easily see how the compliler interpreted what you wanted it to do. If it generates clunky code, a little experimentation will show you what methods generate better code. Of course, this is against modern computer science thinking, which says that programmers shouldn't have to worry about this, because there are optimisers now.
However, this means the programmer now must rely on the compiler vendors to write good optimisers, and except for GNU C, micro computer compilers rarely have well written optimisers.
Personally, I use Pure C now, as I have better uses for the 4 megs in my computer than giving it all to the compiler, but if someone ever comes out with a cheap upgrade memory board, I'd go to GNU in a minute.
Also, as I'm still learning C, the Pure debugger is a major asset in it's favor.

4162. Modula2 on the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-10-16 22:01:21 UTC
From: mrt7455@evtprp0b
Message-ID: <373@evtprp0b.UUCP>
Source record: 216134
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.lang.modula2

What is the status of Modula-2 on the Atari ST platform? It is my impression that Jefferson Software support has died. Ana-systems implementation was mostly just-to-see-if-we-could-do-it. I know that TDI died tho I thought I heard that the source for their libraries was available. FST had an implementation of the language on the ST but after I sent them money for the upgrade that was supposed to coincide with the MS-DOS FST version 2 upgrade, I NEVER heard from them. Modula-2 is a reasonable nice language to work in. Did Jeferson Software ever release the version they were trying to get working on the Atari Minix environment? I remember them saying that it was real close before Jefferson kinda died.

Ah, this time you can't escape - "RTFM" !!
In Gulam, the command
set nrows 50
will automatically set things correctly for 50 line mode. And on the other
point, I have a simple program that I run in my AUTO folder that sets this
mode. I can post the source and binary if you're interested, it's only
about 100 bytes of object code.

Here's a question for someone - is there any way to make the normal desktop
only use 8 lines per character instead of 16 lines per character, when running
on a monochrome monitor?

Well, I can 'duck' it if I can't escape it... I just looked on my Gulam disk... there is both a gulam.doc file and a gulam.inf file. The inf file is about 2.5K longer than the doc... the .doc file contains no mention of the nrows variable at all! I had incorrectly assumed that the .doc file was simply a ascii only version of the inf file which has control codes in it. Anyone else ever notice this?

Several things of note here. One of the original posters who had
problems, had a Mega STe. As 11 sector formatting is often a problem at
16mhz, the first thing to try would be to step the chip down to 8.
Also, zooing the directory tree is only easier for hard drive users. A
third thing to note is that msa 1.41 is a hacked version, as the
original author stopped at 1.39, I belive.
If chaos is this good, though,, I'll have to grab a copy. Does it run off
the hard drive?

Love? It wounds thousands of hearts but does not draw blood (well, by itself.
Ask Romio and Juliet about whether it draws blood...:)

>Chaos Strikes Back:

Got me. I've been too busy with a million other things to even
finish DM I. I wonder if I'll ever get to CSB...:(

>Phantasie I:
> I have visited the Gods, collected all the runes except WATER.
> I can't find it. Do you know where it is ?

Water is in the castle of the Gods, somewhere. It may be a secret
room, but it definately is in a room similar to where you get the rest of the
runes.

>There was a post recently stating that someone saw resumes from a couple
>of engineers at Atari and one of their latest accomplishments was the
>completion of the Falcon040.

Hmm. Beware the English language - it holds traps! If you recall from
that post about the resumes, you will remember that is said that they listed
"development of the Falcon '040", not that they did indeed finish it. They
could have been on the project for one day, or one year. Of course, it is
more likely that they were hired to build one subsystem and as soon as it
was finished, they were let go (contract/consulting job).

Or they may have finished the whole Falcon '040. The point is
don't be suckered by the wording. The point of salesmanship is to
talk about a product so that it seems better than it is, without telling an
outright lie (sometimes truth helps, sometimes not). I realize this is a
rather cynical way of looking at things, but it is all too correct at times.

You may think "what does salesmanship have to do with what these
people put on their resume?", but if you have ever written a serious resume,
you know that your resume is a way of selling yourself without actually being
there (because your resume (copies) can be in 1,000 places at once. You can
not).

Are the 96k binary incompatible with the 56k? What about putting in (I
believe the number is) the 56002? Isn't that an enhanced 56k?

>Now, maybe more 56000 RAM. That would be cool, and transparent to all but the
>OS. SIMMS, too. There is NO WAY Atari can put out memory cheaper than SIMMS
>can be bought for. What was the justification for this?

Remember, atari isn't putting out memory, and from what I have
gathered, the memory card won't even need memory-handling chips on it (refresh,
bank selection, etc.) - all it does is provide an flexible connector for
installing simms. If atari put in simm sockets, someone will complain about
not being able to use their ZIPs, or their DIP memory they have lying around.
Heck, if it could handle the power, you could use 256k chips and a 2-4
multiplexer (or a 16-4) to simulate 1MB (4MB) memory. You can't do that if
all you have are the stock SIMM slots. Oh yeah, I forgot to add SIPPs.
Or any (working) combination of the above, depending on the board.

As it is, I am rather disappointed that the memory-handling isn't done
on the board, as it would allow you to add more than 14MB. Heck, you could
even "move" the unused 2MB above the restricted 14-16MB area so you don't
"lose" it. I certainly hope that the '040 falcon will not have the crippled
memory architecture of the '030. I'm thinking that UNIX will become very
usable on the '040, but not if it is limited to only 14MB (yuck!). Don't
get me wrong, for most purposes 14MB is more than enough (even with multiTOS),
but UNIX is a whole 'nuther order of magnitude (at least in its memory
usage :) .

Source record: 216127

In article <nj3zsg#@rpi.edu> oyakea@rpi.edu writes:
> To all Atari users: I would like to adress this problem of mine
[lots o' stuff deleted]

From the sounds of it, the person has read the specs., but is unwilling to like it anyway. From his conversation with the (IMHO clueless, more harmful than useless) reps., he knows that the video hardware is 15/16bit truecolor, 256 color from 18bit palatte. But he is basing his opinions of the machine on a demo that is either a) badly written, or b) is more complex than he gives credit for and expects more than a 16MHz '030 should be expected to give.

However, his reasoning for liking or disliking the machine is assinine. He says that it is a _bad_ thing to be able to have the same capabilities of (many times) more expensive hardware. There is something just basically wrong with that sort of reasoning. He says:

> The colour palettes and resolutions are very much SVGA-like (8/15/16-bit
>colour from an 18-bit palette). The 32K/65K "TrueColor" modes remind one
>of some of the cards you can get to run Windows in.

Yes it does. This would be because the basic chips to support it are cheaper due to the bulk demands of the PC market (just because the chips are made for PC video cards, does not mean they (or the technology they spawn) cannot be incorportated into other machines. Also makes it nice for porting software if the video is set up similarly (bit planes, no palatte, whatever). Not to mention using cheap monitors that support those standard resolutions.

> Overscanning, interlacing, genlocking - wonder where they got those
>from!! Around the time of the launch of the TT, Sam Tramiel was
>interviewed by a magazine, and he criticised the Amiga 3000 for its
>flicker. Now he builds a machine with interlace.

Lets see - Overscanning - Sts have had that since Oscan (earlier?). Interlacing - True, this is the first time Atari has used an interlace mode, but it is also the first time Atari has tried to put (S)VGA graphics on (a ega-like monitor such as) the SC1224. Of course, don't forget that you aren't FORCED to use interlace - if you get a monitor that is appropriate for the resolution you are using (ie, multisynch that will handle the rez in non-interlace), then you don't get flicker. Simple. Genlock - Thats been around for quite a while for the STs too (especially the STEs).

> Mucho NeXT emulation in things like their choice of DSP, the SCSI-2
>port, the black colour of the case. Even things like BLiTTER and MiNT are
>dead giveaways. Again, in the aforementioned interview, Sam was quoted as
>saying that he hoped that the TT would "clobber" the NeXT. Imitation is
>the sincerest form of plagiarism....

Plagiarism? Are the umpteen million clone companies aware that they
are committing plagiarism by making IBM compatibles, or by just having the
same capabilities? Not! You just get the advantages these devices impart.
With SCSI-2 you get THE fastest standard i/o from hard drives, etc., that
is available for machines less than mini- or mainframes. With DSP, you have
more concurrant processing power. Hardly plagiarism, definately an advantage.

BTW, I fail to see why "BLiTTER and MiNT are dead giveaways". In
name and function, the BLiTTER is similar to the graphics BLiTTER found in
the Amiga. But what does MiNT "giveaway"? True, it is a multi-tasking
environment similar to UNIX (although MUCH MUCH smaller :), but the concept
of multi-tasking was around before UNIX (UNIX just applied it better).
Again, since when is taking the best attributes of another system bad?
It may not be innovative, but it _is_ progress. Using this reasoning, I guess
you could call the Amiga multitasking is a plagerism, albeit an imperfect,
crippled one (not pre-emptive, threading, etc.). The point is, _I_ do not.

> That built-in LocalTalk networking port appeared very similar to
>AppleTalk ports you find on any Mac

Yes, and if someone will come up with decent software to utilize it,
we might just be sitting on an AppleTalk network as one its nodes. Again,
why is this a _bad_ thing?

>I don't mean to incubate :) another Falcon flame war here, so any Atari
>fans reading this please note that the above does not include anything
>other than raw facts.
[smiley flame-bait deleted]

This poster's facts are (somewhat) straight. Its the opinions that he
draws from them that are warped around null-space. :)

> NOW WHAT WE NEED IS SOME OBJECTIVE, NOTE OBJECTIVE REPORTING FROM AN
>ATARI EXPERT. WHO CAN THROW SOME LIGHT ON WHAT THIS GUY'S SAYING.

Listen and use your mental facilities to sift the dirt off of what
this person was saying. His rhetoric has almost convinced you that a dime
is better than a diamond (well not quite, but...). Just draw your own
conclusions from "the Facts", and throw out the opinions.

> I STILL HOPE TO BUY A FALCON AS I CAN'T THROW AWAY ALL MY ST SOFTWARE,
>SO RESPOND WITH GLEE AND OBJECTIVITY.

Why would you want to do that? Supposedly, the Falcon will be more
compatible than the TT, and I know that I am VERY happy with my TT. Oh, BTW,
we are all on the same net, so you don't _have_ to scream at us (using all
caps) and the "!"s get repetitive after the first three. :)

>FROM THE GUY WHO BROUGHT YOU THE WISH LIST !!!!!!!!!!!!!!

4176. Time & Date uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-10-17 04:22:09 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1bo4dhINNjhp@golem.wcc.govt.nz>
Source record: 216139

Okay, a mega-useful (well...) program has just been uploaded to
atari.archive.umich.edu

Filename: TDSS_1_2.LZH
Archived with Questers LHarc version 2.01L (Lh5)

This program performs the usual routine of setting the system's date
and time - BUT - with a difference, most programs require being set
EVERY time you use the machine, so that the date is (for example with TOS
1.2 ROM's) 1992, and not 1987!! This program however, saves the time
and date that you enter into it - and so, when you boot up in future, if
you don't have time, or can't be bothered to set it, the time will only
be as out-of-date as when you last set it!! So, all your file dates will be
more up-to-date!!

Also, it will only ask you to set the time & date if CONTROL is pressed
whilst it is booting! So, if you don't need or want to set it - it doesn't
lock up the machines booting routine if it's in the AUTO folder! (Which is
where it should be!)

It's only 7k, and doesn't install anything into RAM, merely sets the
time & date, then disappears!!

I'm surprised no-one has thought of this before (no-one has that I've seen,
or more accurately, I've never seen any programs that do it).

It's currently in the 'New' directory, but will probably be moved to
'Utilities' shortly!

Interesting statement from someone who's obviously lost in the
Atari ozone..

Get it right before you attack someone...

Atari introduced their own designs for the Atari PC line in
1987.. they floundered around for a few years and never sold
them in the US. They redesigned the line into the "Atari
Business Computers" and showed them at several CES and Comdex
shows, and never sold them in the US.

The Atari PC line, and the ABC line have been sold in Europe and
Canada, but never got very far. As far as I know, Atari has
finally dropped the idea.

(I guess I missed something.. when did Mark Kovarski become the
Atari Cheerleaders' "bashee"..?)

Umm.. the whole point of the "Magic Shadow Archive" is to
duplicate floppy disks..

Trying to "unMSA" a disk to a RAMdisk is asking for trouble..

MSA takes a floppy, subdirectories and all, and mashes the
whole thing into a single file.. the only useful way to
recover the information is to recreate the original floppy, and
THEN move it to hard disk, or RAMdisk or whatever.

The main reason MSA is used for some disks is that is archives the
entire disk including the boot sector. There is no other way that I
know of to save the bootsector to a file along with the program.
That's why most autobooting demos are MSA'd. So I would assume that
chaos is autobooting or else someone just likes MSA.

Did somebody say "wicked" game? :)

I downloaded the thing from a.a as soon as I saw an announcement
of it in this newsgroup. I support the last opinion (above) i.e. have had
no major problems - and the compression with the "-edb" option is very
impressive & quick too. Unlike ZOO however it does not support
generations of files. For me it was a milestone in that, for the first
time on an ST, I can successfully make self-extracting (.TOS) archives. I
know there purports to be an lharc utility to do this but I could never
get that to work. Anyone have any opinions as to whether THAT maybe
corrupted on Atari.Archive?

The STZIP20 does have a minor fault in that its timestamp "-t"
option simply refuses to work on my TOS 1.2 Mega-4 at work. I should
quickly add that it works fine on my TOS 1.6 STE at home. Maybe the
author should give some thought to making this work on "ALL" TOS versions
- which is evidently possible as ZOO achieves it (though Quester's LHARC
{latest I've seen is version "le" i.e. english version L} also fails in
this respect).

All in all - a very worthy archiver, W. Alan B. Evans

4186. New xterm-clone for GEM+MiNT now available

Newsgroup: comp.sys.atari.st
Date: 1992-10-17 12:45:41 UTC
From: mfg@gmd.de
Message-ID: <mfg.719325941@gmd.de>
Source record: 216001

I have just completed the work on the first version of Gemterm. I will upload it as "gemterm.zoo" to atari.archive.umich.edu. Try it, if you like!

Gemterm V1.0

Freeware from Martin Gergeleit (1992)

Gemterm is a xterm-clone for GEM plus MiNT. If you know MiNT, you probably know BG.ACC or TOSWIN. Gemterm does the similar things, but it is optimized for the use together with the Gemini desktop replacement. This means:

- Gemterm provides up to four virtual vt52 windows with concurrent TOS-programs running inside.

- Gemterm is an Accessory, that should run concurrently with any "clean" GEM program. (No, it does not run as PRG so far.)

- Gemterm supports the Gemini VA-protocol, so that dragging of objects into Gemterm-windows results in inserting the objects name as text, as known from the Gemini-console.

- Gemterm uses GDOS fonts.

- Gemterm provides a scroll-back buffer and allows for cut-and-paste of text between Gemterm-windows.

- Gemterm-windows may be defined to be persistent. This means a window will resist a change of the main GEM PRG without the need to reopen it by hand.

- Gemterm can save its status into a configuration file and will reboot to the saved configuration. It will also start up again the TOS programs inside its windows.

- Gemterm also serves as a (very) basic terminal program.

- Gemterm claims to be "clean" itself.

- Gemterm comes with sources and it is free.

BUT:

GEMTERM COMES WITH ABSOLUTELY NO WARRANTY, NOR WILL I BE LIABLE FOR ANY DAMAGES INCURRED FROM THE USE OF IT. USE ENTIRELY AT YOUR OWN RISK!!!

Gemterm has not been tested very much so far. I used it myself during the
development and I tested it with some GEM PRGs. It runs on my machine, a
260ST (yes, they still exist even in the age of the falcon) + 2.5 MB, a
monochrome SM124 (I don't know what happens on a color screen), TOS 1.04,
MiNT 0.95, and Gemini 1.21. Gemterm should run on any ST on any TOS,
but I have not tested it on any machine other than mine.
I will try to do any sensible bugfix, but I will not support any fancy speed up
extensions (Hard- or Software) nor any other ST models or TOS version, as I
have no access to any TT, STE or Falcon.

On the other hand: Gemterm comes with the complete sources (even if comments
are rare and the code is not very pretty). It is compiled with gcc 1.40 and
mintlib Patchlevel 20, so if you suggest any enhancements: Try it!

If you have any ideas, bugreports, ... , drop a mail to:

..

:^) I'm surprised no-one has thought of this before (no-one has that I've
seen,
:^) or more accurately, I've never seen any programs that do it).

Trust me, it's been thought of. I have been thinking about writing such a program for about three years--I've just been too lazy to do it. Thanks for uploading this gem!

Btw, the version I envisioned would somehow hook into a system timer or some other call so that it updated its internal time _off of the clock_ periodically, which would be useful for people who often leave their machines on for days at a time and then off for a while--the time would be set to a time near when they turned the machine off. This would be silly for people who boot off of floppy, but for users of AdSCSI w/ no clock...

Annius Victor Groenink Universiteit Utrecht PTT Research

But you'll still have to pay more than 100$ to get that PureC.
I hope for this price I'll get a C++ compiler (and a good one)

PureC is great with a very good environment, but GCC is free and is
a very good compiler !

> the Atari Minix environment? I remember them saying that it was real
> close before Jefferson kinda died.

There also exist another PD-modula 2: LPR Modula-2
(LPR stands for 'Lehrstuhl fur Prozessrechner', the university
that ported it from Mac (the ETH-version from Wirth))

It doesn't seem to be supported any more and lacks good libraries
(the ones included are limited and partly bugged)

It is relatively close to the TDI environment (with a link-loader)
and has a pretty good editor (but you can use another one if you wish).

All the compiler, debugger and editor can be kept resident in memory,
which helps to get a fast environment.

All in all: the environment is relatively nice (fast), but the libraries
have to be partly (re)written and the generated code is not excellent.

>camp.

Ok, now hold on just a moment here, Mark. First you tell us EGM "reported"
the Falcon 2 years ago, then you tell us the rumors are coming from the Atari
camp. Which is it? Also, how do you know the Jaguar doesn't exist? Just
because it isn't released is no reason to believe it's not in development
or such. I've heard of a 686 chip by Intel in the works, but gee, according
to your definition, it doesn't exist, so I better just forget about it.

I'm sure you know by now not to believe everything you read,
right? Especially not from a well-known tabloid like EGM. Unless perhaps
you have some secret way of getting info that Atari corp hasn't released to
the public, perhaps you could stop spreading rumors yourself. No one
really knows anything about the Jaguar officially, ok?

4193. Falcon test clarification

Newsgroup: comp.sys.atari.st
Date: 1992-10-17 16:56:32 UTC
From: wmagro@uiuc.edu
Message-ID: <Bw9z2A.ABn@news.cso.uiuc.edu>
Source record: 216005

Thanks to all for the positive e-mail responses I have received regarding my first-hand Falcon030 report. Two clarifications need to be made. First, all the tests were made with _identical_ binaries on both the ST and Falcon. Therefore, no 68030 specific code was used to my knowledge. Some of the commercial demos may have embedded 68030 code which is used when a 68030's presence is detected. Thanks to David Winick of NCSU for pointing out that TeX and MiNT would benefit from a 68030 specific recompilation.

Second, after testing a 14M/65Meg machine, I stated that I felt the $800 would be worth it for the new machine. John Hutchinson reminded me that this price is for the stripped down 1M model with no hard drive. This, however, is the model I would buy, as I already have a substantial investment in hard drive space. The total conversion cost would be <$80 for the new (expensive!) 'Honda' mini 50 pin cable plus ~$250 more for a 4 Meg RAM upgrade. (None of the tests I performed were particularly RAM intensive.)

Finally, Ed Krimen publicly and playfully harassed me about getting some mainstream ST software. I apologize for the poor list of titles tested, but please understand that I primarily use my ST as a terminal and for games. My field of study is Quantum Monte Carlo techniques, so most of my computer requirements are handled by our research machines. I just don't own any real ST productivity software. If anyone would like to know whether a specific (and common) product runs on the Falcon, I can try to have it tested. My user group includes several DTP, MIDI, and OCR/Scanner enthusiasts who own a wide variety of titles. Just ask, and I will try.

4199. For Sale : Processor Accelerator

Newsgroup: comp.sys.atari.st
Date: 1992-10-17 18:09:57 UTC
From: jkrakover@sma2.rain.com
Message-ID: <1992Oct17.180957.2492@sma2.rain.com>
Source record: 216034

FOR SALE------$150 / O.B.O

Processor Accelerator for Atari ST computers.
-Made by C.M.I
-Has slot for 16Mhz 68000
-Has slot for Blitter coprossor
-Has slot for 68881 FPU
-68881 has slot for its own crystal allowing for any speed desired
-Uses 0-wait state FAST ROMS
-Has toggle 8/16 Mhz switch
-Has direct processor expansion slot

NOTE- This board requires some expertise to install, you may need to read the manual two or three times as it is a bit difficult to understand. Also, if you has a version 2 motherboard (as I do) you will need to install a extension cable since it will not fit over the processor (keyboard is in the way)

If your interested, contact me here or at 503-666-8568 I'm on a very same network, so your E-mail may bounce

Thanks,
Jonathan

>the boring desktop background with a picture, how I can do that ?

I don't know haw to change the dektop under NeoDesk, but it is possible!

>Is it also possible the default font ?

Why don't you use NVDI? It's a *very* good graphic accelerator with GDOS
included. You can change the system font easy and with the
non-commercial program 'backdrop' you can change your desktop background
in every desktop! You just need an IMG as big as (or bigger) your
current desktop!

>Thanks in advance.
> Savino.

Hope that helps,

Knarf

What's "bull" about it? You, Mark, may want user support,
distributed dealer networks, and much more, but most people who walk into
a computer store are looking for a computer. Usually, one of the first
things they see is the computer screen.

>Mr. Krimen, how do you explain the fact that Atari Canada, when it existed,
>was running a Bulletin Board System on a *PC* and PC based software? You
>should know, and I know, that their prime objective is to sell Atari
>ST/(M)ST(E),TT computers thus they should have shown support by running it
>on a ST/(M)ST(E)/TT *WITH* Atari 68000 based code. If the company doesn't
>support their own computers, why should a user?
>

Oh, are we getting formal now? "Mr. Krimen," is it? :^)

What difference does it make WHAT computer the BBS was running on? The
Atari Lynx is developed on an Amiga. So what? The company should pick
the computer which they feel would best serve their needs. In the case
of a BBS, they wanted to use a clone.

What's wrong, Mr. Kovarski? :^) Running out of things to help run Atari
and its users into the ground? I guess we've discussed everything else
under the sun that's wrong with Atari, so now we've got to pick on them
because they use a PC clone to run their BBS in Canada. Oh boy. Did you
know that Atari Base BBS in Sunnyvale is running on an Atari? Wow, what a
concept. :^/

>What do you smoke during the day?

Oh, I guess we're ending the formalities now? Hmm, you didn't ask me,
"Mr. Krimen, what do you smoke during the day?" Anyway, if I did smoke
anything during the day, I certainly, absolutely, unequivocally wouldn't
inhale.

>I am not surprised to see such a message from you, the contributing Editor
>for AEO, a biased magazines that tells people *ONLY* what Atari Corp. likes
>to hear. When are you and your publication going to talk about the real
>real issues that concern the users and stop practicing mindless cheerleading?

Well, I guess we're even then, 'cause I certainly am not surprised to see
such a message from you. You rank right up there with the Chris Mauritzs,
Roger Sheppards, and Bob Retelles. I know that makes you feel so warm and
fuzzy inside.

What I'd like to know, Mark, is why you continue to badger Atari users.
I suppose that makes you feel good when you can spell doom and gloom on us.
I can't believe you enjoy doing this, and that you can't find something
more constructive and worthwhile to do with your time.

>The ST,STE.Mega's are 68000 and the TT and Falcon are 68030's.
>
>Just curious..
>
Well you need to know the differences in the 68K family-

68000- a 16/32 CPU (ie 16-bit data bus w/32 bit internal registers) *
68010- a slightly improved 68000
68020- a true 32bit CPU (ie 32-bit data bus & internal registers)
68030- basically a 68020 with built in Memory Managament Unit.
comparable to Intel '386DX (but not SX)
68040- basically a 68030 with built in Floating Point Unit,
comparable to Intel '486DX (but not SX)

Very few computers were made with the '010. It was not that much of an
improvement. And since so many computers use the '030 & '040, why bother
with the '020- Heck the macs either use the 68000 or the '030 or '040.

*- why a 16 bit data bus?? reason is the chip cases that existed when the
68000 had a max of 64 pins. A chip with a 32-bit data but & 32-bit address
bus would have used them all. Thus the designers were forced to have the
68000 have a 16-bit data bus and a 24-bit address bus. Read the articles
by the designers in the book _68000 Sourcebook_ for these facts.

In a previous article, wells_s@kosmos.wcc.govt.nz () says:

>Atari are using the older STE-type case for the Falcon, because they still
>had a LOT of them sitting in a ware-house/storage area. (Or so ST-Report
>stated)
>

That was just a joke. Unless the person from ST Report that reported it
was stupid.

You just can't take a casing and paint it a new color. It would look
very very stupid when mass producing it.

Also, They would need to poke some new holes in the case for the DSP
port, microphone, stereo jack, and the other ports.

The Timestamp that you refer to is a TOS Bug, get TOS 1.4 and you will find the
Bug gone, also you can fix this fault with the Timestamp TSR's that are around..

Its a simple fault, when a file gets moved/copied with TOS 1.0/1.2 its ends
up getting the current date and time..

As someone already mentioned, if the Chaos demo is a bootable disk, it *can't* be archived with ZOO or LZH or anything like that... the MSA format preserves the exact structure of a floppy, including the boot sector.

You shouldn't have to pre-format the disks in any manner. The MSA utility should re-create the disk exactly as it was when the .MSA file was made, and format your target disk appropriately as needed.

That's what the "Auto-Format" button is for...

>
>Thanks again,
>Phil

You can't post a .msa file disk as a ZOO, it needs the boot sector data..

NOTE: not all disk drive like 11 sector formats, I had a drive that would not
do 11 sector but I found that some one had twiddled with the Index Timing Pot,
I reset this Pot and it the worked 100% OK...!!!

So try to unpack it on another disk drive, you do need 2 drives to unpack MSA
files or a big ram disk...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

4210. DM on hard disk? How?

Newsgroup: comp.sys.atari.st

Yes, and more than likely that screen will show a nifty 1024x768
color demo of Windows or Hypercard going through a demonstration
of a CD-ROM encyclopedia. Due to the fact that Atari alienated
so many dealers in the past, the customer probably won't even see an
Atari product as relatively few stores carry them.

>etc.). The point is, _I_ do not.

AmigaDOS multitasking is pre-emptive, period. Also, since all processes
share the same address space you don't need anything called `threads'. The
only imperfect thing about the AmigaDOS multitasking system is the lack of
memory protection and OS-level resource tracking.

4216. Repairing an old 520ST in the New York City area

Newsgroup: comp.sys.atari.st
Date: 1992-10-18 06:43:16 UTC
From: jrl8@cunixa.cc.columbia.edu
Message-ID: <1992Oct18.064316.8703@news.columbia.edu>
Source record: 216031

I've got an Atari 520ST sitting in my closet that has been
there at least three years. I bought it in early '86 (it was
one of the first with TOS on ROM, I know this because I returned
one I bought a week earlier with TOS on disk). I used it extensively
for three and a half years, until it finally croaked - it seems
to think that all of my disks are blank. I put a disk in, and it
says "0 bytes in 0 files." I have the SF354 single-sided drive
it came with, plus a SF314 I bought afterwards. I tried all combinations
of hooking them up, and it only works once in a while.

I haven't the faintest idea what's wrong with it, but I *really*
miss this computer and I'd like to get it fixed. I'd also like to
buy a new mouse for it, since the one it comes with is extremely
annoying.

I was wondering the following things:

1) Where can I get this thing fixed, in New York City, Brooklyn,
or New Jersey? If anyone had this problem before, how much will
it cost?

2) Since I lost touch with the Atari world three years ago, anything
I should know that happened recently? Back when I lost touch,
30 MB Supra drives were in the $800 range, no one knew when
the Blitter chip would be installed, and the Mega ST's hadn't
arrived yet.

3) MY system contains a 520ST, two external drives, and a color
12" monitor. 512k, obviously. Do I need to upgrade anything
to "keep up" so to speak - in the MS-DOS world, one needs a
new system every year. Is this system enough to run stuff
that came out recently? Back when I used the machine, a hard
drive wasn't necessary (I didn't mind long load times).
SHould I get one now? How large? What about RAM? Blitter
chips?

Anyone who is willing to take the time out and fill me in will
be greatly appreciated! If anything, could somewhere tell me
a store I can go to to get it fixed?

Thanks in advance, a million times over,
-JRL

4218. Help with Neodesk 2 Problem

Newsgroup: comp.sys.atari.st
Date: 1992-10-18 08:35:49 UTC
From: sg47+@andrew.cmu.edu
Message-ID: <gesN9Z600ioXQ3SkMQ@andrew.cmu.edu>
Source record: 216039

I have Neodesk 2 for my computer, and there seems to be a problem with
it recognizing what disk I have in my external drive. The first time I access
the drive I get all the correct information, but if I change the disk
and access
it again, it does 1 of 2 things: either tells me the drive is empty, or
that I have
20-30 folders with strange characters for names, taking up several megabytes
of space. The only solution that I have found so far is to access the
drive when
there is nothing in it, wait for the dialog box that tells me there is a
problem, and
then stick in the new disk and hit OK. This works, but I'm thinking that there
must be an easier solution (auto program of some sort?). I've tried the
program
fmc, and that only seems to make the problem worse (my solution ceases
to work).

I have a 1M 520STfm (TOS 1.0) and a Master 3S external drive.

Thanks in advance for any help.

-Steve

d> amount of disk space taken over by programs which did little or
d> nothing which the much smaller 'all-encompassing' shells can do.

I compiled standard unix bash (for BSD) with Mint + mintlib. No
problems at all which speaks for Mint I think. Of course you should
use minix filesystem so you can use unchanged bash and access .bashrc
and .bash_profile. Gnu utilities do not take so much diskspace. My
'ls' for example is 30 kb. When it is compiled in (like gulam) you
have much less options and functionality and no flexibility if you
don't like the builtin commands. What is more important: you cannot
run them in the background. To do an 'ls &' or whatever you need to
have the utilities as seperate binaries.

d> A side note to those of you who are using UNIXMODE in coding your
d> programs -- don't. It just makes it that much more difficult
d> figure out whether the installation instructions you've given are
d> bombing out because of the UNIXMODE being set up incorrectly, or

I agree; lets only use '/' and not use UNIXMODE. It is a mess and
PD programs, which almost all come from the unix world, need changes.
Now that we have mint and minix.xfs why not use unix conventions?

d> because of program incompatibilities, or because of faulty
d> installation instructions. EMACS 18.58 comes to mind as a
d> perfect example of a UNIXMODE program which proved worthless
d> because of a combination of the above. [Note: read that as
d> 'worthless to me' ... I understand that others have gotten the
d> program to work quite nicely for them after a bit of struggle].

I still cannot make it work (mntemacs.zoo) :-(. After dumping twice
the dumpfix program runs successfully, but the resulting xemacs says
'cannot execute binary file'. Could this have to do something with
UNIXMODE?

d> Any CLI which has to call a 200K+ program to process a TOS
d> directory listing is simply not worth the time or trouble. And,
d> when you add in 200k+ programs to create or remove a directory

Really most of the utilities are about 30 kbyte, not 200.

4221. Uniterm Questions

Newsgroup: comp.sys.atari.st
Date: 1992-10-18 14:07:34 UTC
From: jk@panix.com
Message-ID: <1992Oct18.140734.23992@panix.com>
Source record: 215950

A couple of questions from a novice Uniterm (V2.0e 015) user:

1. I'm having trouble getting the macro command %xmodem to work. Specifically, when the remote system is trying to send me a file by xmodem, I can successfully download it by hitting <Alt>-T, choosing "Receive" at the prompt and entering "filename" and "OK" when the File Selector comes on. But if at the same point in the process use the command %xm('rec','filename') I just get repeated "Bad Chk" error messages.

2. I'm having trouble using the "Run Program" feature. I keep getting error messages when I try to use it ("TOS error 37", for example). Could the problem be lack of free memory? If so, how do I reduce the total amount of space allocated to buffers?

If it's relevant, my machine is an old 520ST upgraded to 1 meg. with

While I suppose the original author has a point, how does this impact
negatively on Falcon's function as a computer? It seems to me that
choosing to complain about how words are capitalized gives the
impression that there is really little legitimate complaint.

Very well, but the utility won't format 11 sector discs.
So there you are on your own, and as far as I can remember there
are also some demos on a.a. which are 11 sectors, so you better
get some formatter that handles that :-)

Newsgroup: comp.sys.atari.st
Date: 1992-10-18 16:09:48 UTC
From: os9paul@gkcl.ists.ca
Message-ID: <1992Oct18.160948.13070@ists.ists.ca>
Source record: 216041

I believe the Chaos game files have disappeared from the New directory at atari.archive.umich.edu! I ftp'ed the chaos.arc file two days ago from the New directory and had a look at it. When I went back yesterday to get the files chaos1.msa and chaos2.msa, they were gone. So was the chaos.arc file. They weren't in Newitems or Games. I issued an ls -lR to get a full current directory. There is a chaos1.msa and a chaos2.msa in the Demo directory, but they produce The Pandemonium Demo from a group called Chaos!

Conjecture: The identical filenames and extensions caused a bit of confusion which lead to the game files being deleted because they were thought to be duplicates of the demo files.

Request: Could the Chaos (the game) files be uploaded again - perhaps with a slightly different name AND a note to Jeff telling him what you have sent.

A minor point, but unless the game disks are already heavily compressed,
the proper way of uploading should be in a .ZOO, .LZH or .ARC file (or
files), with the .msa files contained within the archived files.

Put a Degas picture in the Neodesk directory and rename it to NEOPIC_H.PI3,
NEOPIC_M.PI2 or NEOPIC_L.PI1, depending on resolution.
You might have three different pictures for the various resolutions.

4228. CHAOS: The definitive answers

Newsgroup: comp.sys.atari.st
Date: 1992-10-18 18:14:28 UTC
From: mjb@cs.nott.ac.uk
Message-ID: <1992Oct18.181428.8877@cs.nott.ac.uk>
Source record: 216043

Right, there's been a lot of talk about my conversion of CHAOS, problems unMSAing it and questions about the game.

1. CHAOS is a conversion of a Spectrum strategy game, well, strategy ish game. Don't let the fact that the original game was on the Spectrum put you off though, because there are loads of improvements.. Unfortunatly, the game is 1Mbyte only, but I'm about to upload a 1/2 megabyte version, called "CHAOS1_2.MSA", so if you want to download it before Jeff puts it in the archive properly, then goto Incoming and type get CHAOS1_2.MSA

2. MSA
The program was MSAd using the version of MSA in the Archivers directory. It definately unMSAs properly if you follow the instructions in CHAOS.ARC, because I've done it, and the version LAPD has in its library is the result of the unMSAing.

The program was MSAd because its over 900K long, and MSAing provides an easy way to split up the file onto two floppys so I could upload it... Also, I got someone to specially write a bootsector program, and I wanted to preserve that. Another reason was that the files in the AUTO folder need to be run in a specific order, and also from the AUTO folder. Also, there are a lot of versions of ARC and ZOO around, and not all of them do folders.. For instance, some Lharcs will recognise folders when depacking, but will not create them; I speak from experience.

Right, to get an 11 sector, 82 track disk, use Fcopy III, which should be on somewhere, and if its not, then someone upload it!!

Problems unMSAing; You CAN use a RAM disk to unmsa to; you just need to put the .MSA file onto the RAM disk!

Right, now for some replies to small queries;

It WILL run from HD, but I wouldn't try it if you've got a meg, because you can't really have anything else in memory at the same time, and that includes folderxxx.prg
You really need more than a meg to run it from HD.

CHAOS IS LOW RES (that loud enough??)

Right, now the 1/2 meg version of CHAOS I'm about to upload is VERY cut down, with there being less then half the samples of the megabyte version.. but I thought I'd better do it anyway.. TO repeat, the 1/2 meg version's called CHAOS1_2.MSA and should be in Incoming until you hear otherwise...

Martin

Greetings,

I recently gave some ST Format cover disks away (but stupidly threw
the magazines away instead of giving them with the disks). The cover
disks are #'s 30, 31, 33, and another one with Sequencer One/Canvas.
Would some kind soul here in the Seattle area be willing to fax me the
boot up/start up procedures found in the magazines for the programs on
each of the cover disks. Also, I would be extra thankful if you could
fax me the instruction/documentation for the non-game programs (such as
Sequencer One/Canvas, Write-On (#33), Essential Utilities (#31), etc.).

Email me if you want more specific info, or if you can help out.

Please address the faxes to Marshall Wells. The fax number is 543-3909.

Tremendous thanks,

The bug that causes files to take on the current date/time when copied on the
desktop is not, contrary to popular belief, a bug in the desktop. In fact the
problem is caused by the GEMDOS Fatime (or similar) call which refuses to change
the time of a newly created file. This bug is fixed in TOS V1.04, but for
compatability programmers should:
Create file
Write file
Close file
Open file
Set date/time
Close file
even if create, set date/time, close works for them.

I don't know if my MSTE would have trouble doing 11 sector formatting. As
it happens, I prepared the 11 sector, 82 track disk on a (regular) Mega,
then did the unarcing with msa_141.prg on the MSTE; no problem.

> If chaos is this good, though,, I'll have to grab a copy. Does it run off

Yes, it runs off the HD on my Mega (Tos 1.2). You just need the one file,
CHAOS.PRG (839,290 bytes).

From: Chris_Millar@lppl.mi.org
Message-ID: <Chris_Millar.05ul@lppl.mi.org>
Source record: 215962

This was an old article - The "Falcon", as is refered to in this article, originally meant the Falcon040 - The Falcon030 was refered to as the Sparrow back when it was written. Apparently, Atari was a couple days off of schedule, and couldn't quite get the proto-type Falcon(040) ready for the CeBIT show - in lieu of this, they only showed the Sparrow(Falcon030) to a private group. The Falcon040 rumors (up to this time) are touting an impressive machine - much more so than the A4000 - most people believe that it will be introed in March/April of 1993.....

From everything I can gather about the Jaguar, there are now several companies developing games for it, and it will be released with over 2 dozen (24+) games available for it. It *SUPPOSEDLY* has *2* 68030's (probably 68EC030's at 16Mhz) and has the same video chip as the Falcon (opr a slightly modified one), a custom DSP, and the same analog joysticks as the Falcon (the newly released three-fire button, 12 key keypad sticks) Atari is pushing the "software" development because of what they did to the Lynx - not many games, not many sales.....I hear that Atari will intro the Jaguar at the January CES.....

What Atari system are you using, and how do you have it configured? What terminal program are you using?

Note that it may not be your computer and modem, but it may be the other system's computer and modem. For example, I can call Hayes BBS long distance and get transfer rates that are out of this world (V.32bis) and then call a local board that's also running a V.32bis modem and get really awful transfer rates.

JPEG is a compression of graphics files (GIFSusually). It is very necessary I've been decomping files that are 90K and they end up 400K when done. I believe that Amiga (shudder) or maybe Mac people are the ones that use it the most. There is a Jpeg <-> Gif convertor on Terminator. It's a TTP file though.. so use a shell to run it.

Alex

p.s.sorry don't remember the exact name of the file

4241. English docs for CS-TeX?

Newsgroup: comp.sys.atari.st
Date: 1992-10-19 03:03:10 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <719463789@bronto.cs.duke.edu>
Source record: 215928

As part of a general reorganization of my hard drive, I decided to upgrade my TeX setup (a rather rag-tag collection built out of bits and pieces from a.a), so I downloaded CS-TeX 4.0 and installed it without a hitch. Then I noticed the bit in the readme file about "(time to learn the german language)". Uh-oh. Quick scan of the directory tree confirms the bad news -- no English docs anywhere.

So I come to the net for advice. Has anyone here successfully set up CS-TeX? It looks like the main part of what needs to be done is:

- run initex to make some .FMT files
- run Metafont to make some more fonts (according to the readme file, only a bare-bones set is provided)
- figure out the environment variables; TEXFONTS looks to be the worst

The ideal, of course, would be English translations of the documentation (there wouldn't happen to be any hidden on a.a anywhere?), but barring that, advice on the above matters (and any others that might not have occurred to me) would be much appreciated. E-mail to me; if/when I get things set up (and if interest is evidenced), I'll write up and post some simple instructions.

This is not a smart idea. First of all, .msa files don't compress
very well. Secondly, try asking a 1meg, 1 or 2 floppy, ST owner to
decompress a large .msa file from a large compressed archive. Not
easy. The best way to deal with msa'd files is making sure that each
.msa file is only half of a disk and maybe providing a separate text
file for information.

I haven't come across an .msa file yet that was for a mono demo or
program. But you make an interesting point. There should be an info
file with MSA programs. I know there is a line in the 0index, but
that's not a whole lot of info. Please try to upload a separate text
file describing the demo or program with the msa files.

Your dealer was bullshitting you, to put it bluntly.

At worst, you will have to replace the switch-mode power supply inside
the computer, or use an external transformer.

At best, all you will have to do is make a minor mod to the PSU.
Unfortunately, I don't have schematics, so I can't help you there.

> As you might have guessed, I am not exactly fluent in the electrical/
> electronics area, but I'm ok with a soldering iron!

Dig up a service manual and compare the difference between 110V PSUs and
220V ones.

For those of you who are looking for CHAOS, here is the reply I
received from Jeff regarding its location.

In message <9210181828.AA14535@terminator.cc.umich.edu> you write:
>Concern has been expressed over the newsgroup comp.sys.atari.st
>about the megabyte version of CHAOS (the files chaos.arc, chaos1.msa
>and chaos2.msa), since it has (apparently) disappeared from the New folder
>and not appeared in the Games directory... Any reply? should I upload it
>again with a different filename?
>

Nope, it's still here. We're in the process of moving from terminator.cc
to terminator.rs.itd (for mail and news) and then getting the archives
mounted on an afs capable machine with the rest of the archives.
Most of the new files are immediately transferred over to the new machine
for me to examine, as New is not intended to be publicly readable.

Great! That xterm clone for MiNT and Gemini. But: question:

I've got a problem when running Gemini and MiNT together: when I open my drive
C (my one and only 20 Meg partition) I get

Please insert disk s32546^&*$#567
into drive C

[OK]

Anybody had this problem too and/or know what to do about it?

Does anyone know of a tsr which will restore the clock on a reset?
I mean like a reset proof ramdisk, hasn't anyone written a program
which remembers the clock, trapping the reset, storing the clock,
and adding the stored value on to the clock value when it's run again?
Or something...

Richard

No ! Not this way !!
You have to connect your ST to the scart-plug of the 1084 (your ST produces
a RGB-Signal, so have to use more than one wire for the picture !)
Scart has also a two inputs for sound (left + right), you don't need an extra
wire to the 'audio in' .
In case you want to solder this cable together for yourself, I could mail you
the pinouts for scart and Atari ST. But you should be able to find quite
cheap ready made ST to scart cables.....

Are these numbers for real???? If it's going to cost me this much just to plug my SCSI drive into the Falcon, then I'm going to have to consider my position as regards buying one....I could get a driver board + 120meg HD for a PC for less than that.

>as needed.
>
>That's what the "Auto-Format" button is for...
>
>BobR

Unfortunately, Chaos requires 82 tracks/11 sectors: MSA doesn't support
this formatting. The floppy must be formatted separately (with Fast Copy III
for example), and when you start MSA you have to turn off the Auto Format option.

I must say the doc (chaos.arc) is very clear and I had no problem desarchiving
Chaos.

One thing is strange however: chaos1.msa contains tracks 1-32 (or so),
and chaos2.msa the other tracks, so don't be surprised when msa stops early
with the first file...

Anyway, for people with color monitors, it's a very funny game.

Cheers.

Message-ID: <1992Oct19.095311.2446@wg.estec.nl>
Source record: 215915

Hello there,
Some time ago I asked where I could geta cross compiler for a 6809.
I got as9.ttp from motasm.zoo, but this seems to eat my source file. I've just gotten asm_6809.prg, but this does not seem to generate S1-S9 output.
What I am looking for is a real 6809 xasm which handles things like SETDP and where I can adjust the number of bytes output by the S1-S9 generator.
Please help!
Thanks a lot, Wim Vleeshhouwer.

I remember reading an interview with the FLT people where they said that
putting DM on hard disk probably wouldn't speed it up anyway. Apparently,
it takes so long to load because the game data is being decompressed as it
is loaded. It's the decompression that takes the time.

For curiosity, I tried the PFX Packer on CHAOS.PRG; the compression achieved (is it supposed to be essentially lh1?) was about 3.23%. i.e. the file reduced from about 839,000 bytes to ~812,000. I haven't bothered to try lh5 compression to see how much better that would be.

Hello Atari Users (HAU),

I recently purchased an Atari Portfolio (paid $10 for it ;-) and now I'd like to hook it up to my Real Computers (TM).

Could somebody PLEASE send me information about building my own RS232 interface? I only have a Finnish manual which gives _NO_ technical information about the machine (doesn't even say which CPU it has).

I would also like to add 128K or 256K of RAM to this machine. I have 128K static RAM chips, is there a simple way to connect them to the expansion slot?

And, if you have extra memory cards or an RS232 interface that you'd like to sell, let me know..

Thank you,

Jukka Marin

Source record: 215919

Dealing with Atari Canada was, for the most part OK. They were the worst supplier I had when it came to communication, shipping on time and technical help. Turnaround for service was a couple of months. In their favour, most of the staff was friendly, although I did have some run ins.

Now that Atari Canada has died, I have to deal with Atari USA. The situation has gone from poor to awful. My only impression of Atari USA is that the corporation is, on the whole, suicidal. I thought I had communication problems with Toronto; hell, things look rosy compared with Sunnyvale.

I am close to making a dicision on whether or not I'll give up selling Atari products. Considering I had one of the very first STs ever sold in Canada and that I have championed Atari for years, the decision to quit will be hard. However, if Atari itself does not have what it takes to deal with its customers (dealers), why should I bust my but. They do not appear to care for me or my business (selling their computers) so please tell me why I should have any love for Atari (the company, not the computer).

4265. Re: NeoDesk and MultiDesk problem

Newsgroup: comp.sys.atari.st
Date: 1992-10-19 13:12:33 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Oct19.131233.25688@a.cs.okstate.edu>
Source record: 215926

I found Multidesk to cause problems on my system, one of my editors could not allocate memory with multidesk loaded. I just updated poolfix3 to poolfx92 in my auto folder, and may try again, but Multidesk being removed, along with Maccell (the mouse accellerator from Atari) fixed some annoying problems on my TOS 1.4 system.

> _____________My opinions are my opinions____________ +31 5700 29396 (weekends)

I have also tried to use Gemini and MiNT and came up against this problem. I was trying to overcome the difficulty in using NEODESK with MiNT 0.95 and stumbled on this bug/feature. I found that by clicking on OK the partition would actually open and all the files would be there and accessible. However, its areal pain to have to click on ok every time you open drive C so I gave up and decided to make do with atari desktop and TOSWIN.

If anyone has managed to overcome the problem I'd be very interested in the solution, using Gemini would be a big improvent over the standars desktop.

4269. How to handle the RS232 under GFA-Basic?

Newsgroup: comp.sys.atari.st
Date: 1992-10-19 15:14:18 UTC
From: nienaber@sonne.zedat.fu-berlin.de
Message-ID: <FA4781N@math.fu-berlin.de>
Source record: 215930

I am writing a pttle rogram wich will read the data from a GOULD 1604-
Oscilloscope. The serial port is with XBIOS(15,1,0,-1,...) for 9600Bps and
XON, XOFF configurated. The scope is also set to this parameters. The problem
is: the serial interface dont stop the incoming data-stream even when i dont
get the byte stream. For example:
a) sending 'trc1a' to oscilloscope will set the scope to send all 1024 points
of channel 1. My program is collecting the bytes in a loop. Ervrythig is ok.
b) sending 'trc1a' to scope. Scope will send al 1024 points. Collecting the
bytes in my loop but interupting the loop for doing other things. As a
result most of the sent bytes are lost. --> a XOFF was not sent!???
If i connect my terminal (CoNnect :-)) to the scope i can pause the incoming
stream of data with ^S and continue with ^Q.
In my program i use the INPAUX$-command to get the incoming data. The GFA-Basic
is a version 3.5(or so) wich was distributed some weeks ago by the german TOS-
magazine.
Is there anyone who has experience with the RS232 und GFA or some tips,
routines, sources?
Many thanks in advance!
Bye Hermann

Quite a simple request really. A friend of mine wants to buy a
new computer and isnt sure whether to go for an Atari Falcon or
an Amiga 3000 or 4000. All I know between the machines is
that the Atari has an Amiga-like hardware blitter and the added
boost of a DSP chip (my friend may want to muck around with music)
for less money than the Commodore machines. Quite simply then, what
do people think of the machines?

Please no flames or 'Atari is best 'cos its Atari'. Can you mail
any replies because I will probably miss them on the newsgroup.
If there is enough interest I will summarise.

Hi!
I'm novice in RELCOM. The first problem I met on this way was
that I can't run uupc.bat or uuio.exe on my ATARI 1040ST. I
use PC_SPEED v1.5. That's good, but many communication programs
as well as uuio.exe can't normaly find COM1 and halts. Can
anybody help me to solve this problem? Or maybe I should get
TOS communication program to use RELCOM? Thank You.
Algirdas.

Check out a little PD utility called TIMESET.PRG by Sam Streeper
(SGS softworks) which has been available for donkeys' years. Having set
the time with this program, you can exit by hitting the HELP key in the
which case the time you've just set is written as the timestamp of
TIMESET.PRG in the AUTO folder. Next time TIMESET is executed - it
puts up its own timestamp as the default time. If you don't wish to update
it fully a single keystroke sets it to what you had last time (which
presumably will NOT be 1987!!).

Sorry if this dissappoints you, good ideas are often "reinvented".

Cheers, W. Alan B. Evans

It's not that I've seen a lot on the Atari that's blown away things I've seen on the Amiga. That's not it at all. It's the fact that I've never seen anything on the Amiga that even made me go, "Wow..."

Just a general feeling of non-impression. The only thing I've heard about the Amiga that wass cool, wasn't even about _the Amiga_! It was some guy writing about some piece of hardware that he jerry-rigged to his machine so he could edit his videos (VHS I assumed).

>- figure out the environment variables; TEXFONTS looks to be the worst

I found CS Tex quite easy to set up, for TeX. One suggestion for all
who are attempting to set up systems with foriegn, or no docs. Use Sysmon,
which has ENgish docs. This will quickly allow you to see where and what a
program is looking for.

Well, actually, the auto-formatter included with the MSA utility doesn't know how to format 11-sector disks, so this isn't true. (There are few demos which rely on 11-sector disks, but they DO crop up once in a while.) The MSA utility will tell you that it doesn't know how to format 11-sector disks and that you should use some other formatter to do the job. I've used the program FastCopy III to format 11-sector/82 track disks ... and then the MSA utility worked quite nicely.

Greetings,

I'm looking for a very basic atari system (either a 520 or a 1040ST) with a monitor. No HD or upgrades necessary. All I require is that the machine and monitor be in good working order. I would prefer a color monitor, but monochrome will be considered as well. So, if you have such a machine and would like a bit of cash for it, email me.

Please send machine specifics and a desired price in email. Thank you.

jasond@microsoft.com

>transfer rates.
>

I would also be interested in an answer to this problem as I have just
received my Supra FaxModem. I do know there were connections problems that
have been corrected with ROM upgrades to the modem. I have not been able to
connect to my favorite BBS in this area which is also running the same modem.
It will connect at 14400 baud and then immediately disconnect. A co-worker has
this modem also but on another platform (IBM PC based). Although, I did manage
to connect to one BBS and had downloads in the 1000 chars/sec. range with Zmodem.
My co-worker said to configure the software for the highest speed first before
dialing. He has seen 1300 to 1600 cps rates with Zmodem. My software modem
program was Flash II in this case. Another tip: make sure your modem cable is
RTS/CTS Hardware Handshaking capable - meaning that these pins are wired in the
cable. Also, I'm using the serfx1.prg in my auto folder with a .cpx program
(for the TT) to lock RTS/CTS. I just got the modem the other day with STraight
Fax. So, I haven't used it much - haven't tried the fax software yet either.

I have been tempted to recompile Gulam for MiNT several times now, but
something else has always come up to stop me from getting it done. At
any rate, with the thread support in MiNT it would be possible to have
builtin commands execute in background as well as external commands.
I really want the ability to have all spawned programs run with their
output directed to the ue window... Oh well, with things like tcsh
available now, I think it's time I stopped using an incompatible shell
like Gulam and got back into a real C-shell.

>worry about this, because there are optimisers now.

Well, modern computer science can go take a flying leap, then. }-)
I regularly run gcc on my source code with the -S flag (generate assembly source, not assembled object) and read through the code that's produced. When I see something that looks idiotic, I check the C source and rewrite it. Remember, to the original C programmers, the C language was merely a user-friendly front-end to the system's assembler. If you keep that in mind, then the notion of analyzing the resulting assembly code and retuning is really not strange at all, but one to be expected.

In that light, it sounds to me that Pure C is more in the spirit of the original C usage, it does a good job, but you (the programmer) still have to know a fair amount about your target to get the best possible output. Unfortunately, it also means that you get less performance from off-the-shelf (or off-the-net) source code....

> However, this means the programmer now must rely on the compiler
>vendors to write good optimisers, and except for GNU C, micro computer
>compilers rarely have well written optimisers.

True enough. I dunno, if you care enough about the speed of your code, you will (should?) make the effort to learn the relationship between C source and the resulting assembly that your compiler produces. If you don't take this step, then you probably don't care enough and will be happy to leave things in the hands of the compiler writers. There are lots of things that I write that I simply compile and run without any optimization at all, because I'll only use the thing once or twice. Depends on the overall purpose, I guess.

>
>Jeoff Hines c556212@mizzou1.missouri.edu

Well there are a few ways, like a -r a:\test.lzh b:*.*

will do all files and folders in the root directory of B drive..

If you don't need all the files and folders in B drive, you enter a space in front the folders that you wish to exclude..

a -r a:\test.lzh b:\file1\file2\ *.*
^ note the space here..

This will exclude files and folders in \file1\ and \file2\

If you wish to only archive the files in a specific folder, do this

a -r2 a:\test.lzh b:\file1

Roger..... sheppard_r@kosmos.wcc.govt.nz

Two questions:

I can't seem to find a copy of Bill R's Nroff v. 1.21 for FTPing. Could someone please direct me to a site/directory? I've looked at the comp.binaries.atari.st directory on wuarchive.wustl.edu, and it's not there, and it doesn't seem to be on a.a, but I got a (corrupted) copy from *somewhere* about a month ago.

Also, I would like to find a simple, non-resettable RAMdisk. I only want it for use as a /TMP directory, so, quite honestly, the hassle that a resettable RAMdisk presents, with the regimen of multiple resets and such isn't worth the trouble. I also have no need for print spoolers or sixteen other things. Just a TSR ramdisk. I know they existed at one time...then they seem to have gone out of vogue.

Oh, and now that I think of it--does anyone know of an FTP site that has the original gcc 2.2.2 distribution split into multiple parts? The account I'm working from has a space limitation of 3MB, but I need the original distribution (as a starting point for applying ++jrb's patches), and can't seem to find it in chunks of less than 3MB. Any pointers would be greatly appreciated.

Thanks,

Mike.

Better still, PLEASE let's not put up MSA files when we don't have to.
It looks to me like Chaos is just a standard TOS disk, so simply using
a file archiver (zoo, lharc, etc) would suffice.

I got a directory listing from an FTP site, and I can't look at it because its compressed with this weird .Z mode. I did a binary GET (should I use ASCII?) and I ran a program called compress.ttp on it, but it doesn't do anything. :+(
Do I need to do a TAR on it or something? Thanks for any advice.

> Does anyone know of a tsr which will restore the clock on a reset?

The ST's clock usually keeps going during a reset - and doesn't reset unless it's physically turned off. (A Cold-boot). Hitting the reset button only maybe causes it to lose a couple of seconds whilst TOS re-initialises (Which usually takes longer on an STE than on an STFM - but still not long enough to be a problem!)

My program (TDSS_1_2.LZH) does something similar - but the time will only update to whenever you last set the time. I'm working on fixing that! (E.g. it will update the saved time whenever a reset is done, and save the update in it's setup - so, your time will be more accurate!)

I'm having trouble getting Choas to run on my Mega ST(not E)2 with TOS 1.02.

I've unMSAed everything and the disk works fine on my friend's 1040 STf(not m) w/ TOS 1.0 (I assume). The same disk bombs (3 of them in fact) after it has been loading for a while on my Mega.

I've tried it with a Mega 4 (TOS 1.0/1.04 switchable) and got the same thing with both ROMs (i.e. 3 bombs).

So, I have tried to load Chaos with TOS 1.0, 1.02, and 1.04. It loads on a 1040 w/ TOS 1.0 but not the Mega w/ TOS 1.0 and doesn't load otherwise.

I've tried disconnecting everything except the SC1224 with no luck.

Anybody have any ideas?

Later,
Kenneth Love

Ah... I hadn't realized that Chaos required a disk format that
MSA couldn't provide directly..

I just got the 2 main files from Terminator (although I didn't
see CHAOS.ARC there..), but it might have been in vain, since
I already know my floppy drives won't reliably support 82 tracks.

Too bad, since it did sound interesting.. but I know that a LOT
of ST drives won't go that far out, especially in 11 sector
mode..

Question about installing Dungeon Master on a hard drive..

Essentially the answer is No..

I did talk to someone who'd claimed to have hacked the game so
he could load it on his hard drive, but as an earlier message
indicated, the game is highly compressed on the floppy, and most
of the loading time is required to uncompress it into memory.

Originally FTL wanted to make the game available to everyone,
even those ST owners with only a single-sided floppy, so it was
compressed with a proprietary compression method.. this was also
the reason why ST gamers didn't get the sound options the Amiga
verion had.

As an aside, not that it will help in this instance, the new
release of Dungeon Master for the PC is fully installable on a
hard drive, and only takes seconds to boot up... at least
FTL listened...

I have in fact uncompressed the game program and loaded it from both double-sided floppy and hard drive. Unfortunately I cannot find any of the floppies at this point, (backed up from hard drive and erased from there long ago) so I can't recover it at the moment. If you have an Alpha Systems SwitchBack and at least 2 MB of RAM, and a debugger that lets you set breakpoints, you can accomplish this yourself.

The first requirement is to read the contents of the boot sector and save it as a normal TOS executable, or simply trace its execution. It loads a program called SWOOSH.PRG (SWISH? whatever, it's been a long time) that loads up the FTL logo with the sound effect. As that is executing, it loads up another loader program, which is the decompresser. This is relatively short, but longer than the swish program. Best bet is to list this out, and let it execute up till it transfers control into the uncompressed program. It's fairly easy to see where this happens. At that point, the uncompressed program is complete in memory, you just need to write it to disk. It is a complete TOS executable image, with program header. The next step is trickier, I think the program loads with no relocation info, i.e., it has to run from a particular address, and I certainly don't remember what that was. At any rate, now that I think of it, you don't need SwitchBack to get thru any of this, I used SwitchBack later on to doctor up my characters. (You know, give them maxed out attributes, etc...)

Please don't send me e-mail asking for further info, that's really all I remember and I don't have time to resurrect the details, since I would rather be hacking on GCC and MiNT right now. Suffice to say, it is not difficult to extract the uncompressed program file if you have a decent debugger and understand a bit about assembly language.

>I believe that Minix is too limited to run X
>At least the PC version (with its 64K limit)

The atari ST does not have this limit -- the 68k architecture doesn't impose such idiotic contrains on memory layout.

The major problem of the combination of X and a atari ST is the amount of memory -- since minix does not allow virtual memory (difficult on a ST, doable on a TT, Falcon, or other 68030 machine), you need all to have in real memory. And since a typical X sesson wants about 8-16 Mb, you are out of luck on your 4 Mb (at most) ST.

You might implement VM by swapping -- but that will be a major performance problem. Better wait for a 68030 upgrade, and have enough memory.

Has anyone had success going from a .GIF to a .RAW? I tried:
giftoppm | ppmscale -xysize 320 200 | ppmtoraw

The .RAW just hoses halveway on the purple line.

I also tried going GIF-JPEG-PPM then like the above. just for the hell of
it I tried doing a spctoppm | ppmtoraw, and it did fine, but did not display.
I could save it, but the size was lie 9K...all it was was a black screen.
neiter worked... If you know a way that has worked for you, please send me
mail on how you did it! also, is 2.01 the latest version of Photochrome?
Or is the registered version later (and support gifs?) thanx!

Sounds like the disk drive to me.. I knew when I put it on the 11 sector, 82 track disk that some drives wouldn't be able to read it, but I thought it worth doing to get some more samples on (mainly because my drive can handle it, and so can everybody else's who I've ever met...

There was a mail earlier about something to do with surgery on the drive, maybe whoever posted that could repost with specific instructions.. It IS worth it..

: utilities? Is a pixmap equivalent to the RAW mode of Photochrome?
: Thanks!
: Jeoff Hines c556212@mizzou1.missouri.edu
:
The pbm utilities write to stdout, so you need a decent shell which
can redirect it's I/O. Of course any of the MiNT-related shells (tcsh,
minshel, ...) would be fine, but make sure you use binary standard I/O.
To convert eg. a GIF file to RAW for photochrome, you need to do
the following: (more or less, I hope)

```
giftoppm file.gif | ppmscale -width 320 -height 200 | ppmtoraw > file.raw
```

The program "ppmtoraw" is not part of the pbmplus package, but it's on
atari.archive.umich.edu, probably still in the "Newitems" directory
(ppmtoraw.lzh).

>crashes the machine and sending my work to limbo!

No, a multitasking OS without memory protection is not useless. I do work
with my Amiga 10 hours/day and severe crashes very seldom occur (maybe once
a month). When a process crashes (and it happens a few times / day since I
do software development) the OS just brings up a "Software Failure - Task
Held" requester and if I want to I can choose to ignore it and continue
work like nothing happened.

And there are tools (`Enforcer' for instance) that catches any illegal
memory accesses and tells you about them (and lets the program continue
to run). This is better than just getting the core dumped at you as in
`real' (by your definition) multitasking OS'.

With well-written software there is no need for memory protection. None
of the programs I'm using would work better if AmigaDOS had it. Actually
they would be much slower because of the additional overhead of MP.

This, of course, has nothing to do with Atari, but since the original
post was in this group, I kept it here.

I don't know about DOS type CLIs, but this would be a doddle under any csh (eg
TCSH for MiNT, or Craft). Something like the following would do it. (NB: I can
never remember how to use the basename command without checking the manual, so
it may be wrong below)

------
foreach file (*.mod)
set filename=`basename $file`
lharc a ${filename}.lzh $file
echo Archived $file to archive ${filename}.lzh
end

Kev

Closer to 1670 if I use Ymodem-G. I do have problems disconnecting, though.
Sometimes the modem will just hang there until I hang up on my end. Are some
of these modems unreliable? I had the problem of not being able to connect
with the opposite modem once, but it went away quickly so I am not sure what
caused it. Maybe there is a problem with the new ROMs?

>display JPEG images and anims? What is JPEG anyway, my guess
>is that it is an IBM world standard.

JPEG is a compressed graphics format - generally you would say take a GIF file, compress it (lossy - will lose a little of the quality depending on the compression rate which you choose) and create the JPG file. Of course, you can then convert it back to GIF format (which, as I mentioned about being lossy, will not look quite as perfect as the original). It's not too bad if it has been JPEG'd once, but continual compressions don't do it too good.

Anyways, JPEGV3 (should be the filename) should be available at atari.archive.umich.edu in the /atari/graphics directory I believe - this will let you convert to/from GIF to/from JPG. You might also check out GEMVIEW 1.1m (available same place) - it will display JPG files directly, without need of converting it to GIF first...

Hope this helps...

To all those net users still struggling to un-MSA this game onto the ridiculously large disk format, don't bother!

The game is booring!! OK, it's got some amusing samples (if rather fuzzy), but it hasn't got much else. I mean, have the authors never heard of cursor keys, or even... a joystick! It might have been a classic game on the Spectrum (I loved the spectrum too) but I think we've advanced a bit since then.

Yes, we're working on that but I guess there's still nothing really usable.
I will have to ask Christoph what the current status is (if I remember
correctly, there were two nice net people willing to do a translation).

>- run initex to make some .FMT files

Right. This should be a point-and-click affair. Just select "make format"
(or what it's called) and select the corresponding ini file. Note that you
should first decide if you want to use the "regular" or the "big" TeX, to
avoid having two of each format eating your disk space.

>- run Metafont to make some more fonts (according to the readme file,
> only a bare-bones set is provided)

Yes, but I would do this on a font-by-font basis. If the driver for your
device complains about a font missing, have it produce a font list file, and
feed that to the metafont shell.

>- figure out the environment variables; TEXFONTS looks to be the worst

Not really, just leave it the way it is for your output device. It's all done
for you as long as you use the TeX shell and don't try to use tex.ttp and
friends as standalone programs.

CS was working on other things, but now that he has defected to a MS Windows PC
(for his job) I don't know when you'll see anything new.

Message-ID: <1992Oct20.124032.14162@daimi.aau.dk>
Source record: 216089

I have Megamax Modula-2 for the Atari ST. This is a good and well-supported product.
But you seldom get anything for nothing. For one thing, it is quite expensive. I payed 3000 dKr, which corresponds to roughly 400 $ (when the danish 25% tax (MOMS) is subtracted).
Besides all documentation is in German. That is of course good for Germans, but I guess that most people reading this would prefer English.
To use MM2 you must have at least 720 kB disk space (i.e. not only a single-sided drive) and at least 1 MB RAM. But a hard-disk and another MB of RAM is preferable.

>>problems with Toronto; hell, things look rosy compared with Sunnyvale.

>Care to describe some of your experiences with Atari USA?
==========
When Atari Canada closed its office, I called Sunnyvale. It took 5 calls
before someone was named to handle my inquiries; Barbara Benson. I FAXed
her the details of an order that I had placed with Atari Canada just before
it closed its office (TT, Portfolios). Barbara FAXed me that she would
look after my order and that it would take about a week to process. Her
FAX was on August 13th. The TT came in the last week of September, the
Portfolios arrived last week. Incidentally, I spoke with Shirley Taylor
about the order and twice I was told that the Portfolios had been shipped.
On the third call to Sunnyvale re: the Portfolios, the order was FINALLY
shipped.

I ordered a TT030/4/50; a TT/2/50 was shipped. I called Sunnyvale and was
told a 4 meg TT RAM board was also being shipped. It arrived about 4 days
after the TT. The client has a 32 meg TT RAM board and wanted 4 megs of
ST RAM. I have asked for an RA number for the TT RAM and as yet have
not received one.

The invoice came in for the TT and I FAXed Atari USA to ask if the invoice
was in US or CDN dollars. That was last week; still no reply. If it is
in US dollars, the price of the TT030/2/50 will be $CDN 165 higher than the
TT030/4/50 that Atari Canada quoted me. Now that I have had to supply
2 megs of ST RAM out of my inventory, I will end up losing money on the
sale (my cost is now higher than retail and I have dozens of calls and
FAX charges piled up from trying to get the order completed).

This whole interaction with Sunnyvale has been a disaster. I even FAXed
Sam Tramiel and asked him to tell his Canadian market rep to get on the job.
I have asked if I could get ONE FALCON to demo and I have yet to receive
either a yes or a no.

So, have things gone from poor to awful, you bet! I'll repeat what I
FAXed to Sam Tramiel. I jump through hoops for my clients; any one who
wants to market a product that has inherent weaknesses (low visibility
of Atari makes marketing hard) has do work hard to sell. I expect
Atari USA to treat its clients (its dealers) with respect and to do
whatever it takes to keep product flowing to them. If I quit Atari sales,
I still have a good income to live on. If Atari USA folds, you guys
will be looking for work!!

C'mon, get it together and make it tolerable for me to sell Atari products.

Yo atarist netters,

seeing this new game on a.a., I quickly dl'ed it but couldn't
unarchive it because of a "CRC error" on the last file: war_game.scr.
I've tried all lzh desarcers from my huge collection (say 20...)
and all respond the same, even lzh201i...
Has anyone succeeded ? If yes then how ?

Game can however be started: looks great even if most of the backward
screen is totally scrambled; I couldn't manage to finish it though.

BTW, I'm struck by the quality of most of the games that have been
uploaded on a.a. these days: Combat, Escapade, Dogfight (but doesn't
run on STe), GraphGChess (a little older) and some others,
not to mention the *great* Chaos...
Is this some sort of escalade ? [:-)]

Cheers.

4328. PageStream trick

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 14:19:52 UTC
From: jreiss@magnus.acs.ohio-state.edu
Message-ID: <1992Oct20.141952.16955@magnus.acs.ohio-state.edu>
Source record: 216081

Hello, netters.

Just the other day, I stumbled across a useful trick in PageStream. I'd never heard it mentioned before (and I never thoroughly perused the manual :-), so for all I know this might be common knowledge and I might get flamed for posting such obvious drivel. Still, it's new to me and I though some other people might benefit from it.

If you've used PageStream, you've probably noticed that you can select objects, then move to another page without having those objects DEselected. I'd always wondered exactly why this was. Well, I've found at least one reason. If you move to another page after having selected objects, then tell PageStream to `Duplicate' the objects, the copies of the objects are created on the new page. This provides a handy (if slightly awkward) Copy-to-Page feature akin to the Move-to-Page feature.

Just a little observation for those who are interested. Sorry if this is already known. No flames, please, if it is.

Joe

4334. MiNT problems

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 15:45:08 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1992Oct20.164508@cs.bham.ac.uk>
Source record: 216087

Back on the MiNT trail again, I've set it up on my MEGA/STE running with various oddities (Harlekin II, you know the sort) and TOSWIN, and most things work fine.

I've had problems with just two GEM packages - GFABASIC 3.5 and, and this suprised me somewhat, GENST2 in DevPac II.

It's a real pain and it means I don't normally have MiNT set up.

Has anyone else had problems with these two, or is it my set up? I've tried clearing my AUTOs and ACCs but as long as MiNT's there, they don't work!

David Oakley.

>

Hello, everyone.
Just in case you haven't noticed, I made this one :-)
I'll see about the CRC error. I arced it on unix lharc, not the ST's.
I don't think it makes any difference, but I'll take a look at it.
As to finishing it, well, it's meant for 2-4 human players.
You decide how long it should be, so select a length that suits your need.

Hope you liked it a lot. The map maker is available now.

The .src file is just the screen page. So the game is no different, even if
it happens to be damaged. If you want, I can e-mail you the (uuencoded)
good one, so that you can try it out sooner.

Patrick.

Don't forget, it's shareware ... :-)

>file for information.
>
>Joachim Vance (The Underdog)

Um, I'll agree that most .msa files, especially ones for demos, do not compress very well, but this is not an inherent characteristic of .msa files... The reason for this is that the info on the disk is already compressed (as in those demos) so further compression of the .msa proves useless (and a hassle). A normal .msa file of a normal disk, especially an *uncompressed* MSA file (turn off the compression within msa) of a normal disk, will compress quite nicely especially if the unused sectors are all filled with the same value (as in a newly formatted disk).

Second... I have done what you stated above, with my 1 Meg ST and 1 floppy drive, simply by setting up a 720K RAMdisk. I know, this won't work with bigger disks (>720K), but then again I'm not sure if you can de-msa something on 1 floppy without a RAMdisk anyway.

But I agree that using 2 msa's, each a half of a disk, with an explanation, is the best way to go...

Charles.

4340. CHAOS 1/2 meg version

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 18:31:48 UTC
From: mjb@cs.nott.ac.uk
Message-ID: <1992Oct20.183148.29591@cs.nott.ac.uk>
Source record: 216095

Right, after a short problemo, CHAOS 1/2 meg version
is on atari.archive.umich.edu in the directory
New (until Jeff posts otherwise) called

CHAOS1_2.ARC

I got pi**ed off with people saying MSA is crap, so
I ARCd this, and let anyone try to complain (grrr).

To get the loading screen up, you'll have to rearrange
the order of files in the auto folder to LOADER.PRG
then HALF.PRG (THAT'S why I MSAd it originally!!!)

Martin

(Gordon Bennett, the things I do for you people...)

4341. Re: Jack - from Commodore to Atari

Jeff McWilliams writes
>
>People, in my opinion, have gotten too serious about
>computers. Nobody is happy with what works, it's always gotta be
>bigger, faster, better, when the average joe doesn't really need a
>supercomputer on his desk. He thinks he does, because Intel and
>Bill Gates has told everyone that they do. But they really
>don't.

That's it exactly. The PC philosophy seems to be:

* What you own right now is garbage and something
a million times better will be released Real Soon Now.

* All of the problems involving slow and poorly designed
software can be blamed on technological limitations.
(I think that if the MS-Windows sorted filename display
used a bubble sort, Microsoft would rather wait until
Intel released the next generation of 86 compatible CPUs
than use a faster algorithm.)

* Everyone, including Grandpa Jones who bought his computer
at Sears, yearns to perform the duties of a 1972 mainframe
systems administrator.

* Software should be non-intuitive and needlessly complex
in order to support the millions of people who make a living
by publishing rewrites of the manuals for MS-DOS, Windows,
Harvard Graphics, etc.

Hey, I *own* a PC compatible. I can make snide remarks about
it if I want to :-)

4343. Help with DeskJet 500?

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 19:45:34 UTC
From: horsch@cs.ubc.ca
Message-ID: <1c1nkuINNihh@carib.cs.ubc.ca>
Source record: 216097

My Dad purchased a DeskJet 500 for his ST and is having trouble. The ST is 1Meg, about 5 years old, 20Meg hard drive, etc. He uses Page Stream (I think it's a recent version, but I've been out of the Atari world for a while--and across the country too!), and Word Writer (an early version). The DeskJet is brand new.

Any advice on necessary techniques, software, drivers etc, emailed directly to me, would be greatly appreciated. Other advice, particular that which is posted here, will probably go unnoticed :-)

>gone out of vogue.
>
Check out the ramdisk that comes with the TURTLE hard disk backup
system called TRAMDISK.PRG. It is an extremely tiny program, can be set up
in all sizes with any volume letter (C:\ -- P:\). Further its default size
& volume letter is easily configurable and it understands command line
invocation from a shell. I've used it a lot for things other than backing
hard disks with a good deal of satisfaction.

Cheers, W. Alan B. Evans

4346. Re: English docs for CS-TeX?

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 22:46:17 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <719621176@romeo.cs.duke.edu>
Source record: 215954

Well, it seems my fears were premature. Thanks to:

ee90grb@brunel.ac.uk
atari@cs.ruu.nl
don@cc.gatech.edu
petcher@ebenezer.wustl.edu
h.vandenberg@math.utwente.nl
DAVEW%D.SSS.CO.UK@ib.rl.ac.uk

and anyone else whose mail arrives after I post this :).

As promised, I'm posting the results of my efforts. If this doesn't
interest you, hit `n' now:

As it turned out, the key was the GEM shells provided in the
installation [having been born and raised on a vt100 ;), I was looking
for a command-line method]. The shells of interest for English speakers
are CTEX_E.PRG in the \TEX directory and C_MF_E.PRG in the \METAFONT
directory.

Recall that my concerns were:

>- run initex to make some .FMT files

Cake. Two steps:

Step 1 -- Find the file LATEX.INI in the directory \TEX\INITEX
and load it into your favorite text editor. Find the line
that reads "\dump{latex}" and change it to read
"\dump{lplain}". Save under the name LPLAIN.INI.

Step 2 -- Run CTEX_E. Under the _Find_ menu, choose _IniTeX_ and use
the resulting dialog box to find and select INITEX.TTP (the
program will generally guess it right anyway). Then under
Work choose _Generate_, and select PLAIN.INI in the
resulting dialog box. Repeat with LPLAIN.INI. This creates
the necessary files PLAIN.FMT and LPLAIN.FMT in the directory
\TEX\FORMATS.

>- run Metafont to make some more fonts (according to the readme file,
> only a bare-bones set is provided)

Fortunately it appears I won't have to do this (although I'm sorely
tempted to build that "wasy" font to see some of the neat symbols in
it), though it appears that this would be easy as well. C_MF_E uses
"font list" files with the extension .FTS; you can apparently simply
tell C_MF_E to generate all the fonts on that list (first, of course,
make sure that all the necessary .MF files are where the program can

find them).

>- figure out the environment variables; TEXFONTS looks to be the worst

Double cake. Run CTEX_E and choose _Environment_ from the _File_ menu
(I think that's the name of the menu), and copy down the values shown.
Install them with your favorite environment-variable program [mine's
MiNT ;)].

Finally, for those (like me) who'd rather run TeX from a real shell
rather than the GEM wrapper, the following tcsh aliases should [1]
suffice:

```
alias tex 'e:/tex/bin/tex.ttp \&plain'
alias latex 'e:/tex/bin/tex.ttp \&lplain'
alias preview 'e:/tex/bin/dvi_view.app -p=a4'
```

modulo your directory structure and preferred shell, of course.

The only thing I lack now is documentation for the special graphics
extensions like CSG, but I shouldn't need those for a while. Thanks
again, and I hope this saves someone out there some time and
frustration.

-sbigham

[1] I say "should" since I haven't actually tried the aliases, though
the commands themselves work flawlessly; my tcsh.rc is still sitting on
a backup disk waiting for me to finish my hard drive reorganization.

4347. Atari OS

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 22:59:45 UTC
From: darren@ICSI.Berkeley.EDU
Message-ID: <1c2311INNlkh@agate.berkeley.edu>
Source record: 215953

We just got a news feed (finally) and in my pokings around the comp.sys groups I discovered the announcement of the new Falcon. I have been following the rumors and discussion with great interest. Though I know a few happy Atari users in the computer music world, most of my experience is with NeXTs and Macs. Compared to the most nearly equivilant Apple or NeXT product, the Falcon seems like a great deal! I haven't owned a machine since my first AppleIIe was sold in 1987 because I've had consistant access to machines at schools. Now that I've graduated (MFA in electronic music) I'm thinking about getting a machine and am very tempted by the Falcon's hardware specs, especially the 56K. Would anyone care to attempt a decently impartial refutation of the consistant rumor that Atari hardware is great and well priced, but the system software is fairly lame?

4348. Opinions of assemblers?

Newsgroup: comp.sys.atari.st
Date: 1992-10-20 23:52:34 UTC
From: tevans@unislc.uucp
Message-ID: <1992Oct20.235234.7505@unislc.uucp>
Source record: 215958

I am presently taking a class at the local university where I am required to write programs in assemble language for the 68000 processor. So far I have been able to obtain to assemblers, gcc-as and turboass. However, gcc-as doesn't follow the common motorola syntax (ex move.w --> movew on gcc-as) and I don't know german so it is a little hard to figure out how to use turboass.

Now my question: Is there an assembler for the atari that follows the normal 68000 syntax? If there is (are), how good is it? From what I could figure out from playing around with the turboass it seems to follow the motorola syntax, however, does anybody know of a version in english? Are there english docs available somewhere for it?

Thanks in advance!!

>foreach file (*.mod)
> set filename=`basename $file`
> lharc a ${filename}.lzh $file
> echo Archived $file to archive ${filename}.lzh
>end

to avoid starting another process (basename, unless builtin), try:

set filename=${file}:r

or just

lharc a ${file}:r.lzh $file

provided the shell supports this (tcsh does). also note that some
archivers do not need the .lzh suffix.

as an aside, you might want to look into rich salz's shar2 system which
has heuristics for putting files into shar archives and keeping their
size < 50KB or so for mailing. this could be extended to 720KB disks,
perhaps. find it in comp.sources.unix archives...

There is a program for compressing .IMG files - which can often reduce their file-size by quite a lot! And, it saves them in a standard IMG format again! Not too sure *how* it works, but it does - however, I'm not too sure as of the name of the program - does anyone know the one I mean?

Apart from that - very few programs support compressed pic's! (Some will view pictures packed with 'ICE-Packer' but they are only usually slide-shows convertors, or viewers!

4353. Will PCDITTO 3.01 run on STFM 1.2 tos?

Message-ID: <1992Oct21.044615.4056@zooid.guild.org>
Source record: 215968

The subject line pretty well sums it up.

I start PCDITTO, it asks for, reads the MSDOS disk and then the drive stops spinning, the drive light goes out and and it goes off to never never land.

The PCDITTO disk is an MSA copy of a system that was running fine on an STF computer..

What's the differenced between an STF and STFM ?

Is anybody running PCDitto on an STFM?

What version?

>sale (my cost is now higher than retail and I have dozens of calls and
>FAX charges piled up from trying to get the order completed).

I've spoken to three of the Toronto dealers and without fail they are
ALL reporting the same problems! I was actually encouraged that
Atari Canada were shutting down, as the type of operation was costing
Atari money; BUT I expected they would leave an intact
sales/marketing force.

Now, this is turning into an UNMITIGATED DISASTER!! Toronto is one
of the top four markets in North America (L.A., Chicago and N.Y.
being the others), there is a strong (for Atari) user base and
dealers can't get stock, or can only get it at prices that are
completely irrational, given the market here. WAKE UP ATARI -
PLEASE!!!!! Don't lose the market share you have, here.

It's not screen size that's the problem, it's the amount of code you need to implement. You've got to put in TCP/IP and sockets for a start, then the low-level X network protocols, X intrinsics etc. etc. before you've even thought about a window manager such as Motif / Athena / Open Look.

However, given that Quaterdeck seem to have done Desqview/X on the PC, I don't see why it couldn't be done on the ST.

Message-ID: <1992Oct21.103828.8370@crc.ac.uk>
Source record: 215970

I have managed to get fcpy_iii.lzh to allow me to format a 11sector 82
track floppy and this worked!
What I did was to put the chaos*.msa in a ramdisk and send it to the floppy.

There is one problem, this *isn't* the game. It is in fact a demo from
Pandemonium(?), which is quite good but not what I expected :-)

I downloaded this from the demos directory because at the time it was the
only one I could find. I have now downloaded chaos1,2.msa from the Games
directory so hopefully these will be the right ones!

I will get there in the end :-)

No , you can't buy a Falcon in Norway yet.

I have heard that an Atari agent in Sweden has been decided, but the name has not ben desclosed yet.

Be patient and things will suddenly drop in your head. Heavily.....

Yeah, I was surprised when GenST bombed out under MiNT. I dunno what
the problem is, but I gave up in the end and used the Sozobon
assembler (since it's format is not too different).

4366. Looking for several PD programs

Newsgroup: comp.sys.atari.st
Date: 1992-10-21 11:40:14 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <5997@tuegate.tue.nl>
Source record: 215975

Well as the subject says I am looking for some PD software that I could not find on the regular archives like a.a. or sol.cs.ruu.nl.
I hope someone knows where to ftp these or maybe someone can upload these to a.a. or so. If I get e-mail I am also willing to do some uploading myself (that is if someone sends me a uuencoded file)

Here they come:
Public painter, author: Hansjuerg Buergler
program for painting mono .img pictures.

Special paint, author: Alexander Lorenz
program for painting mono .img pictures (yes I would like to have both :)

Laborant ST plus, author: Jens Schulz
generic chemistry program.

Matrix, author: Andreas Krompke
matrix processing program with nice desktop user interface.

Funcalc, author: ???
numerical calculation program with nice desktop user interface.

Klima, author: several people
program that creates climate diagrams of worldregions.

Soundcomputer, author: Thomas Wiedel
program to use the atari soundchip.
Well any program that can make songs usable in my own programs will do.

Wator, author ???
Simulation of sharks and fishes in the sea.

This is it. The programs have been around for at least two years so a lot of people must have them by now, especially in Germany. So please help me with this and I can help a lot of other ST users with this software.

Greetings Erlend.

Hi People,

In a few weeks, I shall be losing my job -- found out last Friday. Of course, the *important* loss is NetNews access! So, as of November 30th I shall no longer have the means to access this (and other) news groups :-(Hopefully, it won't be too long until I'm in another job on the Internet. But until then, au revoir! It's been great these last couple of years reading and contributing to this newsgroup. Thanks to everyone who's helped me from time to time with problems ranging from screwy hard-drives to "should I buy a DeskJet 500"? Hope to be in touch soon!

Cheers,

Hi Gemterm-Useres (if there are any?)

there is a real problem with Gemterm, if there is no GDOS present: It crashes !
It it is my fault, that I have forgotten to check the presence of GDOS before
using the call vst_load_fonts(). If there is no GDOS this call crashes.

So I think there are four possible bug fixes:

1) Install GDOS. This is the most sensible fix, because on an ordinary SM124
it is VERY GOOD to use other fonts in an 80x25 window than the system fonts.

2) Recompile Gemterm with gcc and mintlib with the following change:
File: gemterm.c, Line: 592

```
if (vq_gdos())
vst_load_fonts(handle, 1);
```

instead of simply:

```
vst_load_fonts(handle, 1);
```

3) Wait for the next version of Gemterm with this bug fixed (a bad solution)

4) If nothing else helps ask me for the new binary, I will mail it to you.

PS: A good shareware GDOS called "AMCLIGHT.PRG" and resonable fonts are part
of the Gemini 1.21 distribution.

Keep on Gemterm-ing,

Martin <mfg@gmdzi.gmd.de>

>
>What version?

Question... why don't you have the original PCDITTO disk? That _is_ copyrighted,
commercial software, you know?

In "STF" and "STFM", the "F" means built-in floppy and the "M" means RF modulator
(for running on a TV set). Other than that, they should be the same. Before I
sold it, my PC Ditto (version 3.0 software) worked fine on my 1040STfm, as did
the ill-fated PC Ditto 2 (hardware version).

>

Well, thanks for all the replies including the one email message from Ann Arbor.
I appreciate it. I did manage to call my favorite BBS with some help. Apparently,
the BBS connection from my place can be pretty noisy. Before I called I sent some
AT commands in terminal mode to set the baud rate to 9600. I connected with no
problem. However, the Zmodem download failed twice. So, I tried a Ymodem down-
load and it worked with slightly less throughput (800 to 900 cps). Now I'm
working on getting STraight Fax to recognize my modem when sending a FAX.
I am now getting 'Modem not responding. Please check modem power and RS-232 cable.'
or 'Modem initialization error. Please check modem power and RS-232 cable.'
Any comments on this. I'll probably give Joppa a call.

CUL,
Chuck

That's it! Do you really need all this TCP/IP shit? I can't imagine you
couldn't fake an Xlib that does the same to programs that use it as on a UNIX
machine. (But I suppose I'm talking nonsense)

5) Throw it away and unzip your TOSWIN again. The program is un-useable.
TOSWIN, being *just* useable but a little naughty as far as GEM is
concerned, seems a lot more reliable to me. All GEMterm gave me was a
window, very slowly redrawn, with something in it that periodically
resembled a Mandelbrot set rather than a terminal.

How much memory do you have on your Mega? I have a 4MB STe, and it
bombs with some programs, but the problem is fixed by running a 2 MB
RAM-disk (reset proof preferably, so you can boot the games/whatever
disk without letting the 2 Megs go). I'm not sure why this helps, it
just does :). 3 bombs means address error, so it has something to do
with the memory I'd think.

Well, I hope he doesn't mind me pointing fingers, but the man you are looking for is Howard Chu, the Man at JPL. :)

Actually, I've been trying to get him to dig his mod out of the depths of his boxes (he had just moved) for the last several months, but as yet I have been unsuccessful. Perhaps if more people were to show an interest in his modification we could persuade him to post a program to make the modifications, or at least tell us how to do it with a file editor...

To add more rumours to the jaguar story, I have to tell some of the rumours
I picked up some time ago. The processor would be som 64Bit processor, and
probably a RISC at 20+Mhz (hell, I now this seems unlikly, but this is what
I heard), and the video chip(s) will be the same as on the Falcon, but not
as on the F030, but rather as on the F040!

Remember that the pricy things in electronic & computer devices today is the
caseing, powersuply, keyboards, I/O connections and other mechanical devices.
I guess, if you striped the falcon 030 for all interfaces exept Audio, Video
and joyports, replaced the keyboard with 4-10 buttons, removed floppydrive,
put it in a smaller & cheaper caseing, removed all expansion-slots (e.g.
alowing only a 4MB version) it would probably cost some 300US$ A hell of a
games-consol it would be too!!

Now, if the above rumours about the Jaguar are close to the truth, and it is
put into some cheap caseing with few ports and gadgets, it might be possible
to sell it for < 500 US$
Such a games-consol have power to do VR (Virtual Reality)! Wouldn't that be
something to get 'high' on? :^)

Oh, I just love rumours!

No, I think the problem is that the hardware and system software are great and priced well, but the computer suffers from lack of support and marketing.

The system software has been upgraded a number of times in the past few years to the point that I think most people can say that it's pretty good and usable.

|> That's it! Do you really need all this TCP/IP shit? I can't imagine you
|> couldn't fake an Xlib that does the same to programs that use it as on a UNIX
|> machine. (But I suppose I'm talking nonsense)

I don't believe you need sockets for X, using a fifo would be just as good. A socket is really nothing more than a network-wide fifo anyway. If you were willing to sacrifice the network-ability of X (which would be fine for most ST users, having no standard network), then fifo's would be fine.

There is also the point that shared memory is available under MiNT for things like colourmaps, RootWindow structures, etc. Since this is the way that most modern X vendors have gone, it seems profitable to me!

As for the X intrinsics, they're written in X (AFAIK), so that once you've written an Xlib, you can do virtually anything. The main stumbling block is memory. What we need is EITHER shared libraries, OR virtual memory/swapping. Of course, both would be preferable. I suggest that shared libraries is much the more feasible alternative, since swapping *really* needs a 030 or above (fine for Falcons but not much use for ST(e)s).

I don't know whose domain this falls under, (either Eric's or Howard's I expect) but it's out of my league. I'm a 'competent' C programmer, but have no experience in doing this sort of thing. All the more power to those who do.

As an aside, I have a friend who has a 486/33 running Linux (a free un*x clone), and he can have up to 18 applications concurrently running in 8Mb *WITHOUT* swapping, because he has shared libraries. I think 4Mb (the Max on most ST's) ought to support a fair amount of processes if we can get proper shared libs.

Is there something I'm missing or is this the next logical step for MiNT ?

Simon.

PS: I reckon MiNT ought to be called MINUTE because it's so ***SMALL*** compared with other Un*x-alike implementations....

MiNUTE Is Now Unix (Tos Extensions) ??????

Source record: 215996

>mbaffoni@skat.usc.edu (Michael Baffoni) writes:
>: Speaking of which, has anyone ever seen an Alternate Reality Dungeon
>: disk? Was the City the only one made for the ST?

Alternate Reality: The City
Was originally developed on the Atari 8-bit computers, ported to the C-64, ST, and Amiga computers (maybe the Apple as well). The ST version of AR: The City was enhanced slightly for better graphics and allowed one to join some guilds.

Alternate Reality: The Dungeon
On the Atari 8-bit and C-64 only, I believe. A new character system was made, and all of the guilds were reproduced on the upper level of the Dungeon and allowed one to join them. But the two orignal authors, Phillip Price and Gary Gilbertson (programming and music/lyrics, repsectively) were hired on the project as consultants only, the software company (DataSoft or DataMost) was reorganized under its parent company, Intellicreations. Supposedly a lot of man hours were dedicated to the AR project so that the basic game system module was developed, which would be the standard core for future installations that would be able to follow quickly due to quicker production.

But Intellicreations folded, I think. AR went down the tubes from that point. The Dungeon was a significant improvement over The City, the Arena was to be the next module. Price/Gilbertson sort of dropped out of the s/w market, I believe.

Compuserve's Atari 8-bit forum found them and got them to release a bunch of musical demos from their career, there was talk of an X-mas release of related holiday music, but that didn't ever happen.

I got my hands on an interview with Phil Price where he detailed an entire overview of the AR series, modules, and ideas. A sort of a retrospective. I have no idea when it was made or its original source. I should probably U/L it to the archive.

4390. Dungeon Master

Newsgroup: comp.sys.atari.st
Date: 1992-10-21 23:30:46 UTC
From: markjl@acs.bu.edu
Message-ID: <99252@bu.edu>
Source record: 216000

Hello everybody,
I just wanted to know if anybody is in touch with FTL (Faster Than Light,
the company that made Dungeon Master, DM) these days. As far as I know their
entire history goes something like this:

Put out a public domain, unplayable demo of DM which has significant background
to the game. (Maybe a little better than reading the novella! haha)
Produced DM for the Atari ST, recieved incredible reviews and success.
Produced Oids for the ST, a simple blast-em up game.
Ported DM to Amiga, Mac, IBM.
Produced Chaos Strikes Back, expansion disk #1 to DM for the ST and ported
it to other platforms.
Produced the Dungeon Master CD, I know nothing more about this. Toad Computers
supposedly can order this.

What is FTL up to now? Have they ever done anything other than what I know of?
I wonder if one can contact FTL, I think they still exist. Can the Atari
series of computers expect more FTL products in the future?

Thanks.

4394. More GCC problems...

Newsgroup: comp.sys.atari.st
Date: 1992-10-22 00:19:28 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Oct22.001928.11614@u.washington.edu>
Source record: 215852

Ok, just when I thought I had all my GCC problems solved, a new one pops up! When I first got GCC installed on my TT about 1 1/2 weeks ago, temp.c compiled fine. Now it won't. It gives me:

```
temp.o: Undefined symbol ___gedf2 referenced from text
```

This is my temp.c:

```
#include <stdio.h>
#include <stdlib.h>

#define LOWER -66
#define UPPER 400
#define STEP 20

main()
{
float fahr;

printf("This is the coversion table for Fahrenheit to Celsius\n\n");
printf("FAHRENHEIT CELSIUS\n");
for(fahr = (float)UPPER; fahr >=(float)LOWER; fahr = fahr -
(float)STEP)
printf ("%f %f\n", fahr, (5.0/9.0)*(fahr-32));
exit(0);
}
```

When I take out the "for" statement, it compiles fine. It compiles hello.c fine, and it compiles this:

```
#include <stdio.h>

#define LOWER 0
#define UPPER 300
#define STEP 20

main()
{
int fahr;

for(fahr = LOWER; fahr <= UPPER; fahr = fahr + STEP)
{
printf("%3d %6.1f\n", fahr, (5.0/9.0)*(fahr-32));
}
exit(0);
}
```

fine. They all compile fine on the UW's unix machines. I don't believe there's anything wrong with the program, as I've had several competent people look at it...

Thanks for any ideas...

Source record: 215853

For sale: the following equipment.

Casio CZ-5000 - Midi keyboard with built in 8 track Sequencer.
full size keys. excellent condition.
Casio CZ-101 - Midi keyboard, mini keys, four voice monophonic
mode. Makes an excellent sound module.
Roland TR-505 - Drum machine with 16 pcm voices. Stereo. excellent
condition.
Boss KM-600 - Keyboard mixer. 6 in stereo out. headphone jack.
excellent shape.
Yamaha YME-8 - Midi through box. 2 in 8 out.
Yamaha R100 - reverb processor. Stereo out. Midi.
All cables - all midi cables and instrument cables.
All manuals - All original manuals and Extras
Cz Android - Patch program for the keyboards.
Tiger Cub - Dr. T's software sequencer.
Midi Recording Studio - Dr. T's Sequencer.
Keyboard Stand - Custom stand hold both keyboards, drum machine,
and mixer.

All are in excellent shape and I've never had a problem with anything.
The entire set-up for only $1000.00.

4398. JRI Genlock board for TT?

Newsgroup: comp.sys.atari.st
Date: 1992-10-22 02:47:17 UTC
From: nickd@vpnet.chi.il.us
Message-ID: <1992Oct22.024717.19461@vpnet.chi.il.us>
Source record: 215870

I'm mostly happy wity my TT, but one type of output 'port' that the TT does not have is NTSC (composite) video output. I've been told that the Video Key RGB-to-NTSC converter for the ST does not work with the TT (or at least, not in TT resolutions). Rio Computers sells an NTSC converter that might work with the TT, but for reasons that I don't want to get into here, I'm loath to purchase anything from them (but the way things are going, may not have much choice).

That leaves only one other "candidate" that I've heard of: JRI (John Russell Innovations?) is supposed to be producing a Genlock (and NTSC converter) board for the TT. I noticed that B&C Computervisions listed this board in their ads in Current Notes and Atari Interface (magazines) in April, but I have seen no mention of it since (even in B&C's catalog). In a conference on Delphi, Bob Brodie said something like "JRI is working on some other board now."

Does anyone know if JRI is going to finish & release their TT Genlock board? Can anyone give me their address (USmail or e-mail if any) or phone number, so I can ask them? Does anyone know of other alternatives? I don't actually need genlock (although that would be nice), but want some way to get NTSC video out of my TT, without buying one of those super-hi-res graphics boards, if possible. Too bad that Atari didn't include NTSC output among all those 'ports' on the TT.

Thanks in advance for any information.

Nick DiMasi nickd@vpnet.chi.il.us Delphi: TURBONICK

Source record: 215811

MJ> Compatability: Chaos should work on any machine with 1Mb+ of memory whose
MJ> disk drive can handle 11 sectors 82 tracks. I don't know about it
MJ> working on the STe, TT or Falcon; any offers anyone?

One note to compatibility... You might get "problems" with national keyboards... As on the old ZX-Spectrum, Chaos uses the keys around the "S" on the keyboard as "cursor" keys... On the English/American Keyboard, there is the following key layout:

q w e

a s d

z x c

On the German keyboard, the Y and Z have changed their positions - so controlling the "cursor" might become a bit strange...

MJ Bronlow, could you perhabs change this and send an "Update" of Chaos to some German ftp-servers, so that we here in Germany get a better working version of Chaos?

yours,

Benedikt

4400. Anyone with recent copies of ST Format please read this.

Well, the original Dungeon Master will soon be available for the
SuperNintendo and Dungeon Master: Skull Keep is planned for the
Sega Genesis CD system (as mentioned in the Sega Visions house rag.)
The picture from VG&CE of the SNES DM looked rather weak compared to
the ST version. The shot of Skull Keep looked exactly like an ST shot
(the area along the side was identical) so maybe...just maybe...
BTW, no release date was given for DM: SK.

Where did you get the info about the '040-style package' and
'similar external bus' ?
I don't know anything about those two things, but it would be a
big surprise if it was true !!!
The 68060 is supposed to compete against the 'pentium' (P5)
which has a 64bits wide external bus.

Tell how can a uncompressed file still fit onto a 80 track disk, when it was on
a 82 track disk to start with..??..??

If people are not upto/downto MSA or ULTRA disks then they should leave
well alone..

Stick to Ultra its far better...

In VGA 640 x 480 x 256 colors, 61Hz

If you buy ScreenBlaster from OverScan in Germany, DM 149, then you get the same rez in 80Hz. Or you can increase the rez to 880 x 608 x 256 colors, 61Hz

It is being avalible soon.

Try the solution I used last month when I was having trouble with
Kermit: Use a REAL protocol. I had LOTS of problems sending with
Kermit (and having to set BINARY every time you want to use it is
annoying too...), and I found Z-modem carefully hidden on the system
here, and starting using that with no problems.
Even X-modem is an improvement over Kermit.

>all I can get is a blank screen but I heard the key click.
>Thanks
>...
>Ling Cherd
>.
--- End of notice ---

You should use RGB input and control button setting
^^^
Pin (socket) for 1084S monitor Pin 1 -Green Pin 2 -H Sync
in 3 -Ground 4 -Red
5 -Blue 6 -V Sync

Atari monitor plug (13 pin DIN type) Pin 1 -Audio pin 6 -Green
7 -Red 9 -H Sync
10 -Blue 12 -V Sync
13 -Ground
You will need to bring out Atari pin 1 and ground to phono plug for
1084 audio input (either channel)
(With my monitor the blue and red lines were reversed as to what is shown
in the 1084 manual)
Has worked well -for a sea going product- :-) I also use the composite input
(CVBS) with video tuner for TV

Peter Tucker + Still to come to mind
UNENR LISMORE + A witty line

Source record: 215873

In <16880940F.C556212@mizzou1.missouri.edu>, Jeoff Hines writes:
Hi,
[Lots of MODS->Lots of LHarc Archives]
I simply assume all your mods are in one dir, it would get a little bit tricky
otherwise. Just take Mupfel 1.21 and the external commands "for" and "basename"
(they're quite short, I can mail them to you if neccessary).
Now just type this:

```
---- cut here ----
cd <dir with your mods>
for i in *.mod do 'basename \$i; lharc m $BASENAME $i'
---- cut here ----
```

Explanation:
The syntax of for is "for <variable> in <files> do <command>"; i.e command
will be executed once for each file processed with <variable> set to the
name of the processed file.

Now for the command: Suppose $i is "FOOBAR.MOD". basename will strip all
dir names and extensions from its argument. Unfortunately, basename needs
at least one backslash to work, so we add one. The first command executed
will be basename \FOOBAR.MOD. As a result, FOOBAR will be printed on the
screen and the environment variable BASENAME (<-note that capital letters!)
will be set to FOOBAR, too. The next step is that lharc is called. Just
replace the variables with the values and you get: lharc m FOOBAR FOOBAR.MOD.
Since LHarc automatically adds .lzh to an archive name without an extension,
you'll end up with an archive FOOBAR.LZH containing FOOBAR.MOD.

This should work with all archivers except strange ones like compress and
freeze. If you want to use one of these, just type compress *.mod and
that's all.

Actually, X will run on top of any suitable network; for instance, the
first ports of X to Linux used UNIX domain, rather than TCP, sockets
(these are much simpler, and constituted relatively little code in the
Linux kernel, about 20k of source, I think).

It might be possible to write enough socket emulation on MiNT's FIFOs
to get the job done, although kernel-level sockets would be much
nicer. :-)

BTW, here at Nottingham we run X servers on 3MB Amigas. Slow, and not
very colorful, but they work...

The packer is named SQUEZIMG or something like that. The .IMG format has an inbuilt packer methode, but just some programs use it. The only thing SQUEZIMG does, is to pack the picture with the .IMG format methode and save it again. The routine you use to load .IMG files takes care of the uppacking.

>thought about a window manager such as Motif / Athena / Open Look.

You are confusing current implementations of systems running X-Windows
with X-windows itself. TCP/IP is irrelevant to X-Windows, and sockets
are just one method used in the current implementation.

X-Windows does have a set of commands but they can transported to the
server any way you want.

In my distant past, 4 years ago, I worked on a project that used X-windows
before it had really taken off. Guess what the X server was an 1040ST with
2.5meg of memory. I have called the company I used to work at they still have
the ST with the executable, but they are not sure where the source code is.
The company is Lockheed Sanders, the group is the Military Display Group,
and the project is YF-22a. Even if they can find the code I doubt
Lockheed will make it public domain.

Since the Falcon040 is expected to be horribly expensive anyway why not skip
the 040 like we skipped the 010 and 020? That would be SOME market strategy?
Or would Atari come out with the 040 for the same price as the 030 and drop the
latter, which would be very nice as well.

`Wasn't' the 68000 a processor that had 32 bits inside and 16 on the outside?
That was a good move, for programmers in the 16 bit stage could already get
used to using longword operations. (Look at the average 486 program!).

Hmmm... considering the little hardware necessary for such an expansion
I'd rather say it's an indication that the falcon is a very flexible
machine which can be improved easily!

Besides, for its price-range and purpose I think the Falcon 030 has
VERY good graphics, or have you seen another consumer machine with
true-colour as a standard? If you really need 24bit true colour or
resolutions such as 1280x1024 or so, you'll have to pay the additional
cost - and wait a little longer! ;-)

]Where did you get the info about the '040-style package' and
]'similar external bus' ?
]I don't know anything about those two things, but it would be a
]big surprise if it was true !!!
]The 68060 is supposed to compete against the 'pentium' (P5)
]which has a 64bits wide external bus.

To quote from the 19 Oct 92 issue of Electronic News:

Motorola's 060 is a 32-bit processor with a superscalar, pipelined architec-
ture. It has more than 2 million transistors, using a 0.5-micron, triple-
layer metal, 3.3 volt process in a static design. Performance will be 3.5
times the 25MHz 68040, or about 46 Specmarks, according to Joe Circello,
68000 advanced microprocessor architect for Motorola.

Separated in the 060 are instruction caches and data caches; instruction
fetch pipelines (with four-stage instruction processor, a physically-mapped
8KB instruction cache with four-way self associative, a virtually-mapped,
256-entry branch cache and a FIFO instruction buffer), and operand execu-
tion pipelines (with four-stage operand processor, a physically-mapped 8KB
data cache with 4-way interleaving and a 4-entry, 32-bit write buffer).

The floating point unit--implemented in the execution stage of the operand
execution pipeline--is compatible with the 040 FPU programming model.
Floating point execution times range from 1-24 cycles. The 060 superscalar
dispatch algorithm can execute 50 to 60 percent of integer code instruc-
tions as pairs with existing compilers.

The 060 will come in 040-style packaging, with a similar external bus. The
first versions will sample in the second half of 1993, go into production
in Q1 1994, and run at 50MHz and 66MHz.

>In my distant past, 4 years ago, I worked on a project that used X-windows
>before it had really taken off. Guess what the X server was an 1040ST with
>2.5meg of memory. I have called the company I used to work at they still have
>the ST with the executable, but they are not sure where the source code is.
>The company is Lockheed Sanders, the group is the Military Display Group,
>and the project is YF-22a. Even if they can find the code I doubt
>Lockheed will make it public domain.

So it will be the `Lockheed Falcon' once X they've found the sources and hacked
them onto the new machine? (Will the desktop info dialog with all those
copyrights and licences still fit in the ST Low Rez? A fun form of
incompatibility.)

Can anyone give me a review of this before I go for buying it. What is it like?
What does it do, etc, etc.

Thanks

Erm cannot be of much help, but no one else has offered any help...you need to use a program like Kermit or XYZ(?) or such that allows ascii download.

I used a PC linked into a Xenix Network that linked into a Unix network and I downloaded stuff from Unix to Xenix using a Students prog and then from Xenix onto the PC disk using a comms program called Procomm.

Not much help, I know. But its a start. Look in the public domain I know alot of programs have ascii download and come with on disk manual. Uniterm may have such a facility.

Well I know some people who thought that have the 68000 being a 16/32-bit CPU
was stupid. "Why not go 32-bit all the way?" was their question.
Actually the designers had no choice but to have the 68000 be 16/32. Chip
packages had only 64 pins back then. Thus they had to give it a 16-bit data
bus and a 24-bit address bus to allow them pin for stuff like POWER etc.

This information comes from a MASSIVE volume entitled _The 68000 Sourcebook_
which included articles by the designers which explains the various decisions
they made.

Yes at last, I have got chaos (the game!) to work!!!

It's *MUCH* better than I thought it would be! (this is a compliment :-))

Those samples make the world of difference! It took me 20 mins to stop
laughing :-)

I think this is good enough to be released commercially!
(It's probably too late now though...)

Two quick questions....

Are you going to do any more games?

How did you do the samples? (I would *love* to be able to do that)

Thanks,
Phil

I feel like pulling out my hair.

I have been trying to set up Mercury UUCP and have not been having much luck.
Everything looks right but nothing really happens. Anyway, to the point!

I have heard that Hermes UUCP is on atari.archive.umich.edu!

Could someone tell me where it is located? I'd really like to get it and try
it out.

Since it is in German, could someone also tell me where the new version of the
german-to-english translator is?

I looked for both, but could find neither.
Any help would be greatly appreciated.

Regards,

4438. Falcon vs TT?

Newsgroup: comp.sys.atari.st
Date: 1992-10-22 20:49:27 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Oct22.204927.29400@crc.ac.uk>
Source record: 215893

Having heard some comments about why have a Falcon *and* a TT, I thought I would have a go myself...

Seeing as most people think the ST,STE are crap (compared to hardware available now) I think Atari are replacing the ST,STE with the Falcon 030 (ie games and other *home* uses) and using the Falcon 040(?) and the TT as high power work stations.
Of course I may be wrong, but that sounds sensible to me.
eg 1meg Falcon 030 (no hard drive) for 499(?)pounds.
this is still reasonable for the average home user and has very good capabilities for it's price. It is also easily upgradable with hard drives etc.

I also think that the people who say "I'm waiting for the 040" are falling into the "PC trap". ie "I must get the most powerful/fastest processor I possibly can", when there will always be something better (and more expensive!).
I think this is one of the *only* reasons why people still buy PC's.
Because they think they are getting the fastest processor while forgetting the rest of the machine is crap.

This isn't mean't as a flame, it's just my opinion!

BTW I will get a Falcon 030 as soon as I can. It will do everything I want it
^
to do at a reasonable speed and cheap price.

Phil

4439. HELP needed installing MiNT!

Newsgroup: comp.sys.atari.st
Date: 1992-10-22 21:11:49 UTC
From: jartsu@vipu.hut.fi
Message-ID: <JARTSU.92Oct22231149@lk-hp-16.hut.fi>
Source record: 215895

Hi there...

Some says ago I finally got myself to begin installing MiNT. I dragged _ewerything_ from the Mint/ directory of a.a.u.e to my harddisk and unpacked them to a number of folders.
Then I tried the quick thing I found from the README etc. files. It did nothing sensible. I have all the files needed, and I know that you can make a very Unix-like system with MiNT and all the other stuff available, and so I wish to do (since I have used many Unix-systems on past few years and can't stop now :-) BUT:

I have major problems with the installing. All those README etc. files over there, everything about features, tech-stuff etc. but _nothing_ really helpful about installing. Of course, there are MAKEFILEs to do some of the installing, but 1) I don't have any C-compiler and don't want to install one now 2) the binaries are already there.

So, is there a good documentation about _installing_ complete system based on MiNT and all the various utilities and stuff available for it? I _hate_ browsing through millions of READMEs and MAKEFILES to just to find out what folders do I need to create and what goes where and what do I need to change on various *.CNF-files...

Even a good tree-like description of the folder hierarchy on a "loaded" MiNT-based system would help a lot.

What files does INIT.PRG look for and where?

Can MiNT be booted up from any other drive than C??? I SuperBoot to configure my system.

General help, pointers to any documentation, directory listings, all you can think of, are most welcome!

Thank You!

Jartsu

I use maxidisk which is available from a.a.u.e. It is reset proof and confugurable.
I have it load up common MiNT commands (ie ls, mv, cp, cat, pipe) in the ramdisk and
then have my path look there before where they normally are stored at. Thus
speeding up MiNT also.

4446. Are all roms the same?

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 00:11:20 UTC
From: Mike Stramba <stramba@zooid.guild.org>
Message-ID: <1992Oct23.001120.20356@zooid.guild.org>
Source record: 215806

Very puzzling.

I've received mail from people who have the same model of computer as myself (1040 STFM) who ARE running PCDitto 3.01.

My PCDitto 3.01 refuses to run, it starts up, asks for DOS disk, reads the dos disk and then dies.

Is it possible that my 1.2 tos roms are not the same as other 1.2 roms?

Or are there other hardware components that vary slightly depending on where my machine was assembled?

Mike

AG> Is that still true for 640x400?
I think the resolution won't cause much of the memory problems...

But, what get's me interested is - why does X-Windows run on a standard ATW
with 4 MB RAM? Helios doesn't support Virtual Memory (at least the old version
didn't support it).

yours,
Benedikt

You could get around this order-problem with a simple "trick". Simply rename
LOADER.PRG to YYLOADER.PRG and HALF.PRG to ZZHALF.PRG - then you get the right
order. Even in archives with alphabetically sorted entries - and who cares
about the names of the auto-folder programs?

bye,

Benedikt

>There is a program for compressing .IMG files - which can often reduce their
>file-size by quite a lot! And, it saves them in a standard IMG format again!
>Not too sure *how* it works, but it does

Well, of course it can't compress ALL .img files to produce new .img files :-),
but what it probably does is implement a more effective img compression
algorithm. IMG files can be written in quite a few ways - the simplest being
just writing literal bytes all the time. But the format allows for more
complex algorithms that account for repeated lines, and strings of black
or white space. Even strings of patterns of a fixed length.

FTL's phone number is: (619) 453-5711

You can order upgrades, programs, hintbooks (I recommend the CSB hintbook :), and the Dungeon Master CD (highly recommended background music for playing Dungeon Master and Chaos Strikes Back).

However.. while there were a few bug fixes between versions, and a few minor changes (the Champions "sleep" a lot faster in the newer versions), there was NO change in the copy protection for later versions...

BobR

(Anti-disclaimer... I wrote their CSB hintbook.. :)

4454. Re: Atari/Falcon

Newsgroup: comp.sys.atari.st

The system software in the Falcon is still "Atari TOS", but the Falcon version is MUCH improved over earlier versions, both functionally and graphically.

The first Falcons are expected to come only with TOS in ROM, but Multi-TOS (multi-tasking OS) is expected to ship on disk "soon".

>>rumour.

>Lost? You mean he got fired?

My understanding is that he "left".. ie, it was his move.

Incidentally, he's one of the ones with outstanding interest free
loans from Atari.. in his case, $700,000

That sure would have bought a lot of Falcon advertising...

g> Toolbox? Alternatively, does anybody know if "point" software
g> on the Mac to access Fido-net BBSs will work under Spectre?

Whilst I assume that it probably would, the available Fido point software for the Macintrash is, to put it simply, pathetic.

You will have _far_ less trouble using a setup similar to:

Binkleyterm 3.02a + IOSmail 0.9 + LED 1.0
(Mailer) (mailprocessor) (message editor)

running directly on your ST.

LED is one of the most powerful fido-style message editors I have ever seen, whilst IOSmail is close to the state-of-the-art in mailprocessors, and Bink is a solid, reliable package that has benefitted from considerable improvement of late.

Why should you believe me? Look at the info at the bottom of this message -Yup, I run a Fido system, and use just this combination, as do most of the 'serious' fido ST systems.

My flatmate runs a small mail hub, with a number of Muck users - and they are the bane of his life - unreliable, buggy, noncompatible software that makes them _very_ unpopular on the network.

So what exactly _is_ the heirarchy of Atari computers now that (let's assume) both Falcon's are out? I mean price-wise _and_ performance-wise.

4459. What's the Falcon 030 speed?

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 09:46:26 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <BwKJ5F.G5q@hermes.hrz.uni-bielefeld.de>
Source record: 215813

Buenos Dias!

I've read lots of news about the new Falcon's speed, but I'm not quite sure if I've got any real information yet. Everything that's said goes like "16Mhz" or "fast enough". Since I've never seen any computer with the 68030 I can only guess:

- 16Mhz driven "mainboard" must enable the computer to be two times faster than a normal ST, or a bit faster than the MSTE with 8MHz mainboard, but cache
- 32 bit wide data bus should enable it to be two times faster than a MSTE with 16 bit data bus, or (including part 1) 4 times faster than a ST

(very rough calculations)

So it should be at least 4 times faster than an ST (I'm very well concerned about this being a difficult and dangerous calculation depending on too many things). OF COURSE, there's some change in the processors architecture done, enabling him to do same programs in less cycles, but cause I've never seen one, I don't know exactly.

Since I'm often doing an awful lot of mathematic calculations (for which any existing computer is to slow), I'd like to know in terms of guessed percentage rates, which performance I can really expect?

Any ideas?

I think the `040 trap' is even more serious than the PC one. (Ataris are and always will be relatively more expensive than PCs). But MiNT and MultiTOS getting official is the right time to decide to buy a TT, which can hardly be considered as a trap anymore (in fact, the TT is beginning to be the unique Atari machine that represents the slogan `Power without the price', i.e. the Falcon has no power and no price, and the 040 will have power but also lots of price).

Er.. it depends on what we're trying to do here. I was talking about
implementing an X *SERVER* on the ST, in which case TCP/IP is most
definitely required to connect to any machine that runs the *CLIENT* X
application. Quaterdeck have implemented BSD sockets and streams in
Desqview/X.

If you're going to run both client and server, you need Unix anyway... end
of story. So, I'm afraid that you really do need "all that shit".

Well, I might just be able to save your life <grin>. I've put together a set of disks that install MiNT onto a hard disk. I did it almost a month ago, but we've had network problems, which are now almost resolved, so I'm announcing the distribution.

What it is is a set of 6 disks (boot, 1,2,3,4,5), which install MiNT onto a partition of your choice on your Hard Disk. Note that the partition must be clean. The installation doesn't do that for you.

It installs gcc 2.1 (yes I know it's not the most up-to-date version), Mgr, MiNT 0.95, and lots of utility programs onto either a TOS or a Minixfs partition. It is done with a series of scripts that copy/unzoo/change permissions/etc.

This is very much a beta-release. In fact I'd welcome feedback from anyone who tries to do it (whether it works on your system, what its shortcomings are, or even how wonderful it is - all comments welcome).

I intend to keep the distribution up to date. Since I know what the base system is, I can easily install newer stuff over it. I guarantee that /usr/users/* will remain free of interference from me, but that's about all. When you install a patch, it will always tell you what it is about to do anyweay, so there oughtn't be too many problems (crossed fingers).

A patch to make gcc 2.2.2 the compiler (binaries & libraries) will be available soon. The current gcc is gcc/g++. The newer version is gcc only (according to Howard), and indeed it is substantially smaller than the older version.

The distribution is available by anonymous ftp from phlim.ph.kcl.ac.uk in the pub/MiNT/0.95 directory.

I have told Eric about this and he seems quite happy. The source code for the distribution is available elsewhere in the public domain. I keep only the binaries on my system. Keeping up to date with the binaries will be enough of a load without worrying about source as well. If anyone sees any of their programs that have been distributed into the public domain with 'source must be included etc.', and they want me to remove their program from my disk sets, I will gladly do so. Please email me if you wish me to do this.

Enjoy.

Simon.

Source record: 215818

Here it is now! Wargame is available at a.a. in it's entirety.
It's programmed using GEM and GEMDOS only, so it should work on any Atari. Is there anyone out there who could see if it works on a STe, TT, or MEGA STe?
For the TT, just make sure it's in ST low rez. Cache, or a faster clock speed should make no difference (Except speed up the zoom options, which isn't a bad thing :-) as waiting times are controled with AES's EVNT_TIMER().
Thanks for those who can help.

Patrick.

4476. elvis in a RAM disk (help!)

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 14:26:07 UTC
From: rasas@minyos.xx.rmit.oz.au
Message-ID: <rasas.719850367@minyos.xx.rmit.OZ.AU>
Source record: 215833

I recently aquired elvis (vi clone) and since I have no hard drive I install it along with my C compiler (Sozo) into a (900k)RAM disk. I also (used to) di my vi-ing in the RAM disk. Unfortunately when I try to edit a file over about two pages long the editor bombs (x3) and trashes the end of the file. This does not happen if I open, edit and close the file on a floppy.

I thought I may be running out of room for TEMP stuff on the RAM disk but I still have ~177k free and the file I'm editing is only 7k long! Is this aproblem with my RAM disk (I'm using flashdisk), my setup, or what (my brain?) ?

Many thanks for reading,

Greg.

>
> Eric should know one (there's an indication in the default mint.cnf file).

I wrote my own (it's not particularly good, but the one I used to use
(fastram) didn't work on my TT).

Frankly, I haven't seen any ramdisks that *don't* work with MiNT, although
evidently there are a few. I admit to some mystification; there's absolutely
no reason for a ramdisk not to work with MiNT, unless it's doing something
a bit odd. Just grab another ramdisk from atari.archive.
"fastram" works (except on a TT, but that's true under TOS as well).
If you have trouble installing the ramdisk after MiNT boots, try installing
it before MiNT, or vice versa.

4478. The Falcon Does NOT have True Colour

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 14:34:40 UTC
From: marks@castle.ed.ac.uk
Message-ID: <27237@castle.ed.ac.uk>
Source record: 215824

I really do not understand how Atari can claim the Falcon has true colour. He is my reasoning:

1) To me, and to many PC, Mac, NeXT, and even Amiga users, True Colour is associated with 24bit graphics, that is 16777216 colours. The Falcons palette is 18 bit (262144 colours). Not to detract from the Falcon (which is after all a very nice machine) this is but a fraction of the number of colours required for True Colour.

2) What I suspect Atari mean by "True colour" is that every pixel on the screen is capable of being defined independantly of all other pixels. Even this though is not quite true. Thus far all reports of the Falcon have indicated 65536 colours as the limit for the "True colour" modes. For a low-res (320x200) screen this holds true - there are only 64000 pixels on such a screen. However, for any mode above this - 320x480 for example - there considerably more than 65536 pixels on screen, yet still Atari claim true colour.

I realise that Atari want to sell as many Falcons as possible, but they seem to have gone overboard with hype, giving the consumer an inaccurate view of a machine which, from all reports, ought to be able to sell on it's own virtues. As an example, many people seem to believe, from the material supplied by Atari, that the Falcon has an internal genlock, when in terms of genlocking ability it has little more than the Amiga (such as external synching) in that area. Whilst I hope the Falcon sells, I do not ultimately believe that Atari are being entirely fair to the consumers who will in the end purchase the machines.

Not really. For example, if you don't care about connecting to machines
over a network (i.e. all clients will be running on the same machine as
the server) you could make do with shared memory (and probably get
better performance, to boot). Even if you do want a network,
you could implement TCP/IP on an OS other than Unix; DEC does
it under VMS, and I think Desqview/X allows clients and servers on
the same machine under Desqview.

I'm sorry Mat, I can't let you get away with that. There's nothing that says that the X-transport has to be implemented over TCP/IP. Local sockets will be good enough to allow you to run with both client and server on the same box, while if you're connecting to a remote X client there are other protocols other than TCP/IP supported.
I'll agree that it's probably the most useful (after a local connection) but some of us have to support X over other protocols...

4481. MiNT: Can one stop and restart GEM?

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 15:20:12 UTC
From: djs@jet.uk
Message-ID: <1992Oct23.152012.14552@jet.uk>
Source record: 215762

ST User magazine have finally put something useful on their cover disk
(MiNT 0.95), and I'm up and running with it. The problem is that running
something like BaSH under MiNT suits my development activities well, but,
in order to test the programs I am working on, I need GEM started.

The first approach I took was to let GEM start up, then run the compiler etc
from a TOSWIN window. This works, but GEM gets most of the CPU as it is
busy (polling the mouse?).

What's the best solution? Does anyone have any feeling for how the following
might work?

1) Use renice(1) to reduce GEM's priority when running shell programs.
2) Stop GEM via kill(1) when recompiling etc then restart it using gem(1).
3) Er,
4) That's it.

Thanks in advance for any help...

Hmmm. I'm not so sure that this isn't just nitpicking. To be able to display 65k colours on screen is more than enough for most people. Sure, running at 320x480 will give you more pixels (over 2x) than colours, but be honest about this, on a 153k pixel screen, aren't you going to want a particular colour to be displayed more than once ? I wish our workstations had that sort of capability.

What true-colour means to me (and I expect to most people) is that I can have lots and lots of colours on screen. Not that I can have 16 Million (24 bit), or indeed 65k (16 bit), just lots. I'm not sure I can think of that many applications that use 65k colours let alone 2^24.

As an aside, I have a gif picture (Lush.gif), which is a photo-realistic picture of lots of lush vegetation. It takes 253 colours out of my 256 on the Workstation. When I quantise that down to 64, the effect is still stunning. In fact taking it down to 32 colours makes it merely fantastic. Obviously it does look better in 253 colours, but I think the law of diminishing returns starts to apply. You need a disproportionate amount of colours to make a difference over 65k. What I'm trying to say is that I'm not sure anyone can tell the difference between a 24 bit image and a 16 bit image.

Simon.

If you want to rely on the position of the keys you should use the key code,
with the ascii value (bits 0..7) anded out. This would be a kind gesture to
the french chaos-users (whatever chaos is, I didn't follow this thread).

Atari Canada was a *complete* joke. I have to agree *totally* with this dealer they have not done anything and Atari US is not much better. Why? I will tell you why. A year ago I brought my ST to Atari Canada, after 1 week of investigation they gave me the ST back with a new power cord (wow!!!). I asked them several times if the computer worked now. They told me that they have checked it and they believe it was the cord. I come home, connect the ST and immediately I get the same problem. I asked a friend, who is a technitian to look at it. He did, and after 1 day gave me it back - FIXED. It took about 1 hour to identify the problem spot because the problem would appear and disappear. This showed me that Atari was not serious and that they had horrible technitians.

Atari US is exactly the same way. It doesn't help matters that Atari officials are biased towards anybody that will criticize them. It doesn't help matter that Mr. Bordie, Atari Director of misinformation, is calling other people kiwis, idiots and drunks. What kind of official is this? Where did Atari find him? He is so childish that he put me on his twit list and he confirmed that there are several people on USENET that are on those twit lists as well. I know for a fact that Atari officials were NOT laughing when the Forbes article appeared. Well, they won't be laughing much longer since it is just a matter of time until Atari closes its doors.

I find it also very amusing that the publication "Atari Explorer," is one of the worse publications I have ever seen. You have some Atari officials on the editors list who have access to all the material and yet you produce a publication that is not very informative. People like to read Atari news from around the world, hardware projects, software projects etc. How about writing some interesting articles and not the usual Atari cheerleading?

After I pointed out to you that Atari Canada was running their BBS on a PC with PC software, you responded, "Atari US runs on an Atari machine." You still haven't explained to me why and you are avoiding the entire issue. Mr. Krimen, one of the main ZNet gateways (your publication) is run by a person in New Zealand, and he runs a)a 386/40DX b)PC software. While there is nothing wrong with doing so, it is very ironic.

Mr. Krimen, it is obvious that you have never dealt with a company that is serious about establishing good relationships with their customers and their dealers. You are simply providing excuses for Atari Corporation and nothing else. Maybe if you purchase some day the so-called "garbage PC" equipment and run state of the art operating systems, develop for those companies, you will grasp what good service is all about. Until that happens you will remain in your little world along with the cheerleading Atari fans.

PS: Please don't tell me to go to another confernce since I own Atari equipment, thus I am an Atari user as well.

Sincerely,
Mark Kovarski

Annius,
first of all, comment ot other user, the Falcon030 is not out and people are

already talking about a 040 version and even 060.

There is very little known about the 68060 but it will be either 64/64 or
128/128 if Motorola will ever release it. Currently IBM, Motorola, and
Apple are developing the next generation PC and processors. They will be
the 601, 603, 604, and the 620. Motorola and IBM have a joint research
center in Austin, Texas where this is occuring under the code name "
Kaleida." IBM provides the technology while Motorola will be manufacturing
then. Les Crudele, vice president and general manager of Motorola's RISC

Microprocessor Division sayd that Motorola will continue producing 680*0 series of CISC processors as well as the 88000 line.

As far as the P5 (586) goes, it is ready and it could be shipped as early as

next month but Intel will wait until early 1993. Part of the reason being the recent DXII 66 MHz. Works on Intel's P6 is progressing well, Intel Executive Vice President Craig Barett pointed out at the Montgomery Security conference. It will appear in 1994. The development of the P7 has started in early 1992.

I talked to one official at Motorola Canada and he pointed out that the PowerPc processors will be revealed shortly. Early benchmarks of the 601 indicated at 40 SPECmarks (50 MHz) at integer performance and 60 SPECmarks and for floating-point performance. The 66 Mhz version is 50 and 80 SPECmarks respectively. Those results are based on 1989 tests. The price of the processor will be in the $50 range, according to some sources.

Best Regards,
Mark Kovarski

Well, if you have "telnet" access, you can get the latest issues of Atari
Explorer Online from the Cleveland Free-Net Atari SIG.

>just like the TT with its ridiculous 320x480x256 resolution?

Once again, the Falcon is an entry-level computer, meant to be bought
by the general public, who doesn't necessarily know anything about
computers. Sure, it doesn't have 24-bit 1280x960 color, but what
reason would Atari have for doing this? The extension will be available
for people who think they need higher resolutions for whatever reason
(and there are good reasons for that, of course), while the majority of
the people will be satisfied with the 640x480 or 768x480 it comes
equipped to do. If you want the best and ultimate graphics, you're
going to have to pay for it. Although I do agree the 320x480 is a bit
weird.... :-)

Anyway, I think the fact there are extensions in the works or available
already speaks highly of the market for the Falcon. Do you remember any
such devices for the ST coming out? This is a good sign for Atari,
especially since the upgrades are not as much of a "hack" as they often
were for the ST.

AEO just release a combined issue 16 and 16 file. It should be
making its way through the net soon.
Also stated, AEO is going bi-weekly for a couple months at least, and
there is a possibility that Z-Net will be returning for the in-between
weeks.

> applications that use 65k colours let alone 2^24.

That's missing the point, Simon. I do think Atari is being misleading
on this one. The Falcon has VGA graphics. That's all. That's not bad,
it's what's made the PC the #1 game machine in the world, but it's not
True Color. True Color means that you have at least 8 bits each for red,
green, and blue (heck, the VDI defines 10 bits each, even tho' no color
board exists that goes that high!), with each pixel on the screen being
able to take on any color at any time.

Color registers are useful, but a fast color-specific bitblit can do
the same effects. It's not whether or not your app uses 64K colors or
16.7M colors. It's the ability to select from that massive palette for
the precise color you need (and when doing rendering and digitizing,
24-bit is just barely sufficient sometimes. 30-bit would have been
better. (and we could have had 2 bits for alpha-channel then)).

I do intend to buy an F030, but I'm doing it with the understanding
that it's VGA. That's fine with me for now, but eventually I'll be
giving it a REAL color board. The sound, the OS, and the SCSI-2 are my
main reasons for buying it.

4495. TOS 1.4 info?

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 19:49:01 UTC
From: dumgrunt@ccwf.cc.utexas.edu
Message-ID: <82242@ut-emx.uucp>
Source record: 215840

Okay, folks, I finally made the upgrade from TOS 1.00 to 1.04, but I've got some questions about the new version. The only documentation I received with the chips was Atari's one-sheet announcement of the new version. It only gives a brief list of some of the enhancements over TOS 1.00, including RAnd much more!S I tried writing to Atari to get complete documentation on the newer version, including a full list of the enhancements, but got an essentially useless letter back telling me to contact a dealer. Oh, well, I didn't really expect anything different. I looked in the FAQ files, but they didn't say anything about the differences between different TOS versions. (Maybe this would be a good addition to the FAQ file.)

Of particular interest are changes in operating procedures and system configuration information. Is the keyboard reset a cold or warm reboot, or can both be done? Will existing DESKTOP.INF files be fully compatible, or do they need to be rebuilt? Which operating system bugs (40-folder limit, install application, RTS/CTS, etc.) were _really_ corrected in 1.04 and which ones remain? What AUTO folder patch programs have been released to correct the remaining bugs?

Any detailed information you can post will be very helpful and most appreciated.

According to my information, the 68040 has a Harward architecture, i.e.
seperat data and instruction bus. That is two 32bit wide adress- and
data-buses, giving a total of 64bit wide external bus. I don't know
anything about the P5, but I guess it too has Harward architecture! So in this
respect, Motorola was first!

>
>So what exactly _is_ the heirarchy of Atari computers now that (let's assume)
>both Falcon's are out? I mean price-wise _and_ performance-wise.
>
>

From what I can figure, this would give you a hierarchy of the current Atari models, like you said, assuming the Falcon030 and Falcon040 are to be included. This is not official or anything, nor does it take into account the various strengths and weaknesses of each model -- for example, the Falcon may have better graphics than the TT, but in terms of speed it's not quite as much of a workhorse. Also, we don't really know anything about the Falcon040, so that's a _complete_ guess. :)

Price hierarchy	Performance (speed) hierarchy
Falcon040	Falcon040
TT030	TT030
Falcon030	Falcon030
Mega STe	Mega STe
1040 STe	1040 STe

I guess you get what you pay for. :) If you really wanted to you could throw in the SST and Turbo030 too, those I believe come in somewhere near or above the TT in terms of speed, and in price they're probably reasonable, assuming you have an older Atari to plug them into, and you realize you'll miss out on some of the new features like DMA sound, SCSI ports, and better graphics as on the TT or Falcons.

I have been given the ICD adSCSI ST series software with it and the suppliers told me they were compatible. Anyone used one of these or shed some light on how to drive it.
>
>I believe I need +5v on pin 26 to power it, but what about the software. Do I have the correct software or is there a proper ICD - The Link diskette. When I power up my computer I get an error message of No Host adaptor found.

First, I believe the Link requires version 6.x of ICDBOOT. If you don't have that, then I don't think it's going to work. ICD may be on CompuServe, so if anyone here knows their address there, you could probably send them mail to tell them about your problem. I'm sure they'd love to hear about what's going on in Europe too (re: their products). :^/ Also, the other ICD software on the disk, like ICDFMT, DESKTOP, and HDUTIL, should work properly once it thinks that it's properly connected.

Finally, the Link must be connected to a SCSI device in order to work. The SCSI port, perhaps Pin 26 as you suggested (I can't remember), is where the Link gets its power. Once this is done, it will hopefully work.

Fair enough. I guess we have different requirements. I must admit that I'd not thought of raytracing when I wrote what I did. I guess you can raytrace that many colours. I was more interested in what I would use it for, day to day, (which, you'll be surprised to learn, doesn't include raytracing :-)

|> I do intend to buy an F030, but I'm doing it with the understanding

It is slightly better than VGA isn't it ? I didn't think VGA could put 65k colours on the screen at a time ? I agree that if you define true colour as 8-8-8 R-G-B then the F030 isn't adequate. The thing is that it will be enough for most people, which is *my* point. We're talking (if you believe Atari) about the bottom-of-the-range machine here. Presumably (a BIG presumption) the 040/060? will have better graphics modes.

I agree that the system seems to have a lot going for it. In fact I consider this to be the reason why the cacophony that normally surrounds Atari machines has been directed solely at the graphics. Most Atari computers take a *lot* more flak than the Falcon has. It's the first interesting machine for a long time...

I would add the DSP chip to the reasons for buying it, though, I've been reading about them, and talking to people who use them, and they're wicked chips. If I buy an F030, it'll probably end up being a DSP-based computer that (occaisonally :-) lets the 030 have a lookin :-)

Simon.

From: lenn@mentor.cc.purdue.edu
Message-ID: <BwLKEG.Jo0@mentor.cc.purdue.edu>
Source record: 215755

As the subject implies, I am looking for a used hard drive for my 1040STf.

I would prefer it to be at least 30 or 40 megabytes, but all responses will
be considered.

I want a unit that is complete and ready to plug in and go.

Thanks,
Jody Lenn

All responese will be greatly appreciated.
Also, the $250 is not an absolute limit. If somebody has a great deal
for $260 or $270, I will consider it.

email to lenn@mentor.cc.purdue.edu

4507. screen flicker from TT ram

Newsgroup: comp.sys.atari.st
Date: 1992-10-23 23:14:31 UTC
From: ens@ccu.umanitoba.ca
Message-ID: <1992Oct23.231431.28069@ccu.umanitoba.ca>
Source record: 215768
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I get a very irritating screen flicker (or interference of some kind) whenever the TT ram is accessed. Some programs (like Stalker) are difficult to look at because the interference is present all the time. During bootup, the screen only flickers when tt ram is being tested.

I have a TT with tos 3.06 and 32 Meg TT ram on a GE Soft Mighty Mic expansion board. The inside of the tt is mostly free of the usual shielding found on ST's and an earlier TT that I saw, although the plastic moulding appears to be painted with some kind of conductive paint. There is a metal box around the power supply and a half-cover over what i assume is the source of the rf monitor signal.

Has anyone else had similar trouble and if so is there a way to stop it with strategically placed foil? I tried just covering the memory with foil but that didn't help.

Suggestions welcome.

Werner Ens
ens@ccu.umanitoba.ca

>I can only guess:

Good guess. QuickIndex generally reports 5 times faster than ST performance.
For a nice small loop running in the cache, you could see even more, but you
can reliably count on 4-5 times greater speed overall.

Yeah, that does seem a bit odd. But here's some food for thought - in 384x240 (lo-rez w/overscan) mode, 8 bits per pixel, you can do full motion video (30 frames per second) direct from disk. (Assuming a SCSI-2 disk supporting fast synchronous transfers, and a sustained throughput of around 2.7MB/sec.) Can't do a whole lot more than that; if you take the 5 cycles per access of the DMA controller at 16 MHz, then you have a top speed of 3.2MB/sec for DMAs. I suppose you could use the remaining .5MB/sec of bandwidth for prefetching the next 5 frames, in which case you could run full-bore and *still* have bus time left over for the CPU to manage the rest of the system, for the SDMA engine to play some samples, etc...

Geeze. If I had some video digitizing hardware I'd try it myself, could make for some really cool movie sequences.

4510. Degas font editor/convertor

Newsgroup: comp.sys.atari.st
Date: 1992-10-24 00:16:19 UTC
From: cs2320ak@utagraph.uta.edu
Message-ID: <1992Oct24.001619.17800@utagraph.uta.edu>
Source record: 215751

I am looking for a Degas font editor or a program that will convert either .FED or GDOS fonts to Degas format. OR, a program that will change the system font to a GDOS font would be nice... My .FED font loader (BW_FONT.TTP) doesn't do a good enough job for Flash, because they aren't on the terminal screen. I'm trying to find more Degas fonts because I'm using FONTTRX2 from the Codehead Utilities disk.

I can't see how the total number of pixels can influence the ability to
"[define the color of each pixel] independently of all other pixels:
you have 64K colors, and each pixel can be set to any of these colors
independently of the other pixels (even if the number of pixels is bigger)

OK for the 1st point, but the second is just 'brain-damaged' !

Use Lharc. It has an accessory (PFX) that permits it (although it doesn't use the new lh5 algorithm, as far as I know)
It also has SFX (self-extracting archives) and AFX (automatic extracting archives: on-the-fly decompacter)

I have gathered from the continuing character of this thread that somehow my original post of this never made it to the rest of the net. Therefore, I'm reposting. If I'm wrong, and everyone ignored this because they didn't wish to see it to begin with, please accept my apology. This SHOULD have cleared up some of the questions regarding the 68060 that keep showing up.

--Jerry Dunham

-=-=-=

tion pipelines (with four-stage operand processor, a physically-mapped 8KB data cache with 4-way interleaving and a 4-entry, 32-bit write buffer).

The floating point unit--implemented in the execution stage of the operand execution pipeline--is compatible with the 040 FPU programming model. Floating point execution times range from 1-24 cycles. The 060 superscalar dispatch algorithm can execute 50 to 60 percent of integer code instructions as pairs with existing compilers.

The 060 will come in 040-style packaging, with a similar external bus. The first versions will sample in the second half of 1993, go into production in Q1 1994, and run at 50MHz and 66MHz.

From: wilsont@rahul.net
Message-ID: <BwM25G.42u@rahul.net>
Source record: 215767

LAttice C came with my computer (bought from a friend).
I can't get it to compile in "normal C" mode
(flat memory model, absolute data, 16 bit ints)
it simply can't find the library i want..
i've done a complete installation onto my hard disk. but it always
wants a library i don't have.
so right now. i've gone back to sozobon. It compiles fine!

whats the dael with lattice!? it wants to be a IBM when it compiles
(eg. near and far types.. i hate the ibm for this reason)
why the PC look alike.. its a 68000 in the hood, not a intel piece of junk.

i'd like to get at the lattice optimizer, (the reason for the post in genreal)
will it work ok with a sozobon object file?

thanks alot!

Source record: 215772

Dear Mark Kovarski (and all others who slam Atari service/support):

TAKE A PILL.

Look, I'd be the first to say that Atari's got its problems. I live in Edmonton, Alberta, Canada, where Atari support & service is virtually non-existent. Almost everything I buy I have to buy via mail order, because the only local dealer's got stock so old it remembers when Trudeau was the Prime Minister.

My point is simple. I've heard enough grumbling and doom-'n-gloom from people who own and operate Ataris to make me violently ill. Diagnose your own problems. Fix them. Pull yourselves up by your own bootstraps, and while you're at it, share your experiences with others. And keep your sense of humour. I haven't met a computer company or software outfit yet that hasn't had its share of problems and then some. And if you don't believe me, I'll ask my lovely wife to sign on and regale you with horror stories about how her department at work has been trying to get non-flaky upgrades from Microsoft for their Macs. Or how, at *my* place of work, we've been trying to get the damn LAN to work properly for two months now, and we end up falling back to the good old "sneakernet" solution day in and day out.

Life presents you with problems. You can whine about them, or you can fix them. It's your choice.

Garth

How time flies (when you're having fun?) ... Well, in the intervening two years, fractint for the PC has marched on to ever bigger and bulkier versions (supporting MS-Windows and OS/2 and such now) and what with moving to California and getting other stuff done, it was just too much to keep up with. I also cancelled my Compuserve account somewhere along the way, so I no longer have access to the most current version of the program source. I've been tempted to resurrect the program and add support for the STe palette, and TT and Falcon graphics modes, but haven't had any time.

When there are more pixels than available colours, it's not true that
the colour of each pixel is independant of the colours of all other
pixels. And I think it's obvius that this is what the original poster
intended to say (and _did_ say in fact, when one reads the first quoted
line).
The colour of a pixel is independant of the colours of all other pixels
if and only if there are more colours available than there are pixels.

BTW, how about this Falcon newsgroup that was proposed some weeks ago?
Still a good idea IMO - these threads start getting a bit long-winding
and nit-picking (OK, I admit, in this case I contribute myself, so I'm
guilty... no flames :)

OK folks, it's time we sorted this one out. I'm going to reply to two separate relies in one message, so bear with me. Anyone who doesn't give a hoot about X, MiNT, sockets etc. can press N now:

sjg@phwoof.ph.kcl.ac.uk (Simon Gornall) writes:
>I don't believe you need sockets for X, using a fifo would be just as good. A
>socket is really nothing more than a network-wide fifo anyway. If you were
>willing to sacrifice the network-ability of X (which would be fine for most
>ST users, having no standard network), then fifo's would be fine.

First of all, X doesn't have network ability. It just requires a network to communicate between client and server.

If you "sacrifice the network ability of X" (meaning not having an standard protocol such as TCP/IP), then having X on your ST is pretty damn useless. Why? Because you can't connect to a Unix machine running the X client! If we had both client and server running on the same machine, then we could do a minimal communications library, as done on Linux. But we can't.

>As an aside, I have a friend who has a 486/33 running Linux (free un*x clone),
>and he can have up to 18 applications concurrently running in 8Mb *WITHOUT*

Probably. Eric?

>Simon.

>PS: I reckon MiNT ought to be called MINUTE because it's so ***SMALL***
>compared with other Un*x-alike implementations....

You should check out Plan 9, from Ken Thompson et al. -- a full working 386 system fits on a 1.4MB floppy.

grier@bnr.ca (Brian Grier) writes:
>You are confusing current implementations of systems running X-Windows
>with X-windows itself. TCP/IP is irrelevant to X-Windows, and sockets
>are just one method used in the current implementation.
>
>X-Windows does have a set of commands but they can transported to the
>server any way you want.

Yes yes yes! However, at the current time, almost everyone is using TCP/IP to transport stuff between their X servers and clients. And if the ST cannot do this, then it cannot be connected to anybody else's Unix box, meaning there

is no point porting the server. I believe that this was the original point
of getting the X server to work on the ST.

>Brian, WS1S
>Bell Northern Research
>Research Triangle Park

I'm not trying to throw a damper on the idea, just trying to point out the
hurdles that will have to be overcome.

|> couldn't fake an Xlib that does the same to programs that use it as on a UNIX
|> machine. (But I suppose I'm talking nonsense)

I don't believe you need sockets for X, using a fifo would be just as good. A
socket is really nothing more than a network-wide fifo anyway. If you were
willing to sacrifice the network-ability of X (which would be fine for most
ST users, having no standard network), then fifo's would be fine.

There is also the point that shared memory is available under MiNT for things like colourmaps, RootWindow structures, etc. Since this is the way that most modern X vendors have gone, it seems profitable to me!

As for the X intrinsics, they're written in X (AFAIK), so that once you've written an Xlib, you can do virtually anything. The main stumbling block is memory. What we need is EITHER shared libraries, OR virtual memory/swapping. Of course, both would be preferable. I suggest that shared libraries is much the more feasible alternative, since swapping *really* needs a 030 or above (fine for Falcons but not much use for ST(e)s).

I don't know whose domain this falls under, (either Eric's or Howard's I expect) but it's out of my league. I'm a 'competent' C programmer, but have no experience in doing this sort of thing. All the more power to those who do.

As an aside, I have a friend who has a 486/33 running Linux (a free un*x clone), and he can have up to 18 applications concurrently running in 8Mb *WITHOUT* swapping, because he has shared libraries. I think 4Mb (the Max on most ST's) ought to support a fair amount of processes if we can get proper shared libs.

Is there something I'm missing or is this the next logical step for MiNT ?

Simon.

PS: I reckon MiNT ought to be called MINUTE because it's so ***SMALL*** compared with other Un*x-alike implementations....

You are confusing current implementations of systems running X-Windows with X-windows itself. TCP/IP is irrelevant to X-Windows, and sockets are just one method used in the current implementation.

X-Windows does have a set of commands but they can transported to the server any way you want.

In my distant past, 4 years ago, I worked on a project that used X-windows before it had really taken off. Guess what the X server was an 1040ST with 2.5meg of memory. I have called the company I used to work at they still have the ST with the executable, but they are not sure where the source code is. The company is Lockheed Sanders, the group is the Military Display Group, and the project is YF-22a. Even if they can find the code I doubt Lockheed will make it public domain.

h> would have been more consistent to jus tuse the SCSI bus both internally
h> and externally. So it goes.

Hmm. Would have made sense I guess if there were many 2.5" SCSI drives around -I don't know of any at all.

IDE is also child's play to implement (a couple of 8-bit adressable latches will do, or if you are feeling daring, a braindead DMA port)

And, incidentally, seagate have just released their 200MB 2.5" IDE drive -pricing is, as yet, a little vague. The 120MB ones have been available for >6 months, and compare similarly with other 120MB drives in price, maybe 10% more.

Unless I am very muchly mistaken, PAL is 50Hz non-interlaced... and most of
the world _does_ use it.

It's just technological backwaters like the US of A that stick with NTSC.

Having used both PAL and NTSC video equipment, I would rate NTSC as a close
second to politics in a top-ten list of reasons for leaving america.

How about a DSP version ? With the 48/56 bits internal rez, one should be able to get a precision a little better than float (32bit on this HP) and a little worse than double (64 bit on this HP). The 030 would poke the output stream of pixel values (possibly truecolor pixels ?) into memory. I wonder how fast this would be... Maybe a frame a second ? (*wish*)

My experience has been that even non-interlaced monitors running at 60 Hz can be very fatiguing over a period of time. You don't actually notice any flicker if you're looking directly at them, but can sense a bit of it out of the corner of your eye.

On the other hand, I've been able to use my SM124 monitor refreshed at ~72 Hz for 10 hour+ sessions with no eye fatigue (of course, my back is another problem ;-).

If this wasn't true for at least some other people as well, you wouldn't be seeing monitors for the PC and the Mac being touted with 70, 72 and 75 Hz refresh rates.

Another factor is that higher refresh rates also allow the use of shorter persistence phosphors, which results in reduced image lag and smearing on moving objects.

So, it's not an irrelevant issue.

ok, it's not irrelevant. i just hate to see 60Hz non-interlaced
monitors judged by the performance of interlaced 60 or 50Hz displays.
even tho' 60Hz isn't quite perfect it's quite a bit better.

4537. Proper use of vr_trnfm()? (long)

Newsgroup: comp.sys.atari.st
Date: 1992-10-24 20:18:57 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <82291@ut-emx.uucp>
Source record: 215784

Hi,

I am trying to use a call to vr_trnfm() to help me figure out the correspondence between color registers and vdi color indices. It seems that the only way get this information (from within the program, using only the vdi, so that it works on any machine, including Falcon and TT where I do not know the layout of screen memory) is to do the following:

1) Use the vdi to draw a pixel with some color index,
2) Transform the screen memory that contains that pixel to standard GEM color plane format,
3) Look at the transformed screen memory to see which color register it refers to.

I have tried to implement this, without success. In particular, the vr_trnfm() function does not appear to be working as I expect. I have checked the screen memory after writing the pixel, and it is correct, but after I transform the image, I get an image full of 0's. I tried doing an intermediate copy from the screen with vro_cpyfm(), which worked fine, but when I transform the copied image, I get garbage (but not all 0's). The MFDB structure member which says that the image is in standard format (.fd_stand in GCC) was set to 0 in the MFDB holding the intermediate image.

I am using a 4M 520ST with TOS 1.0. Given the layout of screen memory on the ST, and the size of the image that I am transforming, I think the the vr_trnfm() function should have absolutely no effect on the image (the ST uses color planes interleaved every 16 pixels, and I am transforming 16 pixels). This may not be true on the Falcon and TT though, so I need to do the transformation.

Here are some code fragments to show what I am doing when I try to transform the screen image directly (using GCC 2.2.2 and mintlibs PL 24). Can anyone see what is wrong?

```
--------------------------- edited code fragment -----------------------

#include <aesbind.h>
#include <vdibind.h>

main()
{
. [some declarations omitted]
.
```

```
int xy[2], pxy[8];
long plane[2], map[32];

MFDB screen, planes;

. [standard initialization, appl_init() and v_opnvwrk()]
. [also get palette_size and color_bits]

screen.fd_addr = (long)NULL;

planes.fd_addr = (long)plane;
planes.fd_w = 16; /* min width to get 1 4-bit pixel */
planes.fd_h = 1; /* only need one line */
planes.fd_wdwidth = color_bits; /* number of bits-per-pixel */
planes.fd_stand = 0;
planes.fd_nplanes = color_bits;

xy[0] = 0; /* write pixel at 0,0 position in screen */
xy[1] = 0;

pxy[0] = 0; /* transform a portion of the screen */
pxy[1] = 0; /* the size of the planes MFDB */
pxy[2] = planes.fd_w-1;
pxy[3] = planes.fd_h-1;
pxy[4] = pxy[0];
pxy[5] = pxy[1];
pxy[6] = pxy[2];
pxy[7] = pxy[3];

vsm_type(vdi_handle, 1); /* set marker to a 'dot' */

for(color_index=0, i=0; palette_size--; color_index++, i+=2) {
vsm_color(vdi_handle, color_index); /* set color */
v_pmarker(vdi_handle, 1, xy); /* draw dot */
vr_trnfm(vdi_handle, &screen, &planes); /* transform */
map[i] = plane[0]; /* save */
map[i+1] = plane[1];
}

. [stuff to print out the map array]
.

v_clsvwk(vdi_handle);
appl_exit();

}

--------------------------- end code fragment -------------------------

Thanks for any help.

> here, and starting using that with no problems.
> Even X-modem is an improvement over Kermit.
> ----------

Generally speaking, as it is commonly configured, Kermit is a pig. However, more recent versions support large packets and sliding windows which improves throughput tremendously.

If you issue the following commands on both ends of the kermit connection, you should see a dramatic improvement:

```
set window-size 3
set send packet-length 512
set receive packet-length 512
```

This tells kermit to use 512byte packets and allow 3 sliding windows. Of course, on a clean line you can increase these values and get a larger boost in throughput, but these values seem to get the job done for me on a reasonably clean line.

Regards,

Chris

I don't know if it is true about developers dumping Atari support,
but the phenomenon you are witnessing has been steadily getting
worse over the last 2-3 years. Frankly, I'm amazed at the quality
of some of the MS-DOS games these days.

Everyone seems to be getting loans from Atari. I hope they are paying them back... if not, maybe I can get a loan from Atari. :)

I read in ST Report that he left shortly after the cost of building the Atari facility in Germany was announced of $10 million.

That $10 million price tag sure doesn't go along with the rest of the "right sizing" being done all over the world.

I don't know what's the deal and I'm anxious to hear what happened.

The only good thing that I've been noticing is that more and more people that seem to know what they are doing are being hired at Atari while "old friends" seem to be leaving.

Message-ID: <1cdpvtINN2dg@golem.wcc.govt.nz>
Source record: 215796

I have just uploaded this file ultra11r.lzh to atari/New on A.A.

This is a patched version of Ultra 1.1 done by me, there is no author
mentioned on the disks, so I have called it version 1.1R ..

This is a whole disk archiver like MSA but is better in some ways will work
with one disk drive and no ram disk, but with disk swaping..

The fault with the program was it would only work in the Auto mode,
the manual settings did not work...

Note: will work with 11 sector disks...

Its a LH5 archive (LZH202x)...

Roger..... sheppard_r@kosmos.wcc.govt.nz

> Anybody had this problem too and/or know what to do about it?

I asked Stefan Eissing. He says:

There are two possible reasons:

- Fsfirst() returns a damaged file system label.
- GEMINI.INF contains a line with an invalid label.

In both cases, Gemini will ask for the correct medium (because it thinks that the wrong one is inserted). Try:

- to set a new label for that partition (Mupfel command 'label'), or
- try to start with a fresh GEMINI.INF (move it to a safe place and start Gemini without .INF file).

In article <u894776.719890768@bruny> u894776@bruny.cc.utas.edu.au (James McCoull) writes:
>Try comparing the speed of a falcon in 640x480x256 [31kHz] mode versus the
>A1200 in the same mode.

Well, since I had an extra hour tonight (Daylight savings and all that junk...)
I decided to try a simple test. I timed the execution of my ARC program in
extracting a 95K file on a RAMdisk. This test yielded 100% repeatable results
since using the RAMdisk eliminated disk timing issues. After running the
640x480x256 mode, I got a little more curious. So, here's the results for
various "interesting" screen modes:

Monitor Freq Rez Colors Clock % diff
ticks from best (1228)
SM124 35khz 640x400 2 1265 3.0130

SC1224 15khz 640x400 2 1231 0.2443 (interlaced)
640x200 4 1249 1.7101
320x200 16 1253 2.0358

640x240 2 1228 0
4 1250 1.7915
16 1296 5.5375
256 1398 13.8436
64K 1699 38.3550

640x480 2 1231 0.2443 (these 5 interlaced)
4 1255 2.1987
16 1306 6.3518
256 1447 17.8339
64K 1716 39.7394

320x240 64K 1424 15.9609
320x480 64K 1416 15.3094 (interlaced)

VGA 31khz 640x400 2 1247 1.5472
640x200 4 1288 4.8860 (doubled lines)
320x200 16 1321 7.5733 (doubled lines)

640x240 2 1255 2.1987 (these 4 doubled lines)
4 1306 6.3518
16 1468 19.5440
256 1786 45.4397

640x480 2 1257 2.3616
4 1312 6.8404
16 1453 18.3225

256 1820 48.2085

320x240 64K 1780 44.9511 (doubled lines)
320x480 64K 1814 47.7199

For comparison, here are the numbers for a Mega ST with 16 MHz 68000:

SM124 35khz 640x400 2 2066 68.2410
SC1224 15khz 640x200 4 2061 67.8339
320x200 16 2061 67.8339

As expected, there's no difference between medium and low resolution on the Mega ST. Taking the naive assumption that all else is equal, you can also see that the 16 MHz 68030 is about 1.7 times faster than the 16 MHz 68000. Looking over the rest of the numbers, you can see that in the worst case (VGA 640x480x256) the CPU is getting only 2/3s of the best case performance.

Unfortunately, to get the real answer to the question (compare Falcon to A1200 hardware performance) using this data set is pretty much impossible since you can't factor out the difference in software performance.

PS: fyi, a clock tick is 5 milliseconds.

Calvin,
this is very true. The fact of the matter is, the PC userbase is so big that
if you write a program you have chance of making money. If you write a _very_
nice program you will make lots of money. Companies know that this is the case
and this is also why the games are usually first released for the PC before
any other platforms. Companies, programmers go where the money is...

>The colour of a pixel is independant of the colours of all other pixels
>if and only if there are more colours available than there are pixels.

I have to say that this argument is a bit silly. TrueColor as it were is merely a label that some marketing person decided to apply to something. In PC world, they call 24-bit color with sixteen-million or so colors true color. The human eye is only capable of distiguishing approximately six million, so ten million of these 'colors' are wasted. To my mind, true color would mean that any color from the original image could be reproduced exactly. It has nothing at all to do with the ability to display a unique color on each pixel. It is a case of how close does the tone of a particular pixel come to the real thing. Atari clearly feels, and I am iclinded to agree, that 64k colors is close enough. With the color blending effects that each pixel has on nearby pixels the eye would be fooled into seeing more 'tones' than are actually there. 'nough said.

4555. Falcon - Faulty SCSI 2 port?

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 00:24:45 UTC
From: shore_c@kosmos.wcc.govt.nz
Message-ID: <1cfdsdINN7pc@golem.wcc.govt.nz>
Source record: 215704

I was talking to someone on the phone today,
and they told me that someone had posted a message on another network
about the Falcon's SCSI2 port, saying that looking at the pinouts
in Atari's specs for the machine, that if you plugged a SCSI drive
in it, it would either kill the Falcon or the drive. I think he
said that pins 5 & 11 were around the wrong way, but I may have those
numbers wrong. One is ground, and the other is +5v.

Can anyone confirm this?... Is the guy that posted the original message
wrong, are the specs that Atari released wrong, or is it wired wrong
in the Flacon?

Over the last year i've seen heaps of requests from time to time
for a program to backup your HD.
Someone told me of one today that i've had all along, but didn't
realise that it could, and I think a few others are probably in the same
situation.

The program is FCOPY III , you select what format you want your
destination disc to have, turn verify on if you want to be extra safe,
choose get used sectors only, unless you want to back up all the
unused HD as well!, then select the main option "Streamer".
FCOPY III then gets you to select the partition to back up, then
asks for discs as it needs them!

I guess I should read manuals sometimes!!!

Craig.

Message-ID: <1992Oct26.032933.26714@alw.nih.gov>
Source record: 215709

I have the Cyber Control program from Antic Software, and there's a note about needing CAD-3D 2.02 in the introduction. I have CAD-3D 2.0, and the manual says the upgrade is free. Does anyone know if Antic Software still exists, or how I can upgrade my copy of CAD-3D from 2.0 to 2.02?

Also does anyone know if the whole Cyber suite is still actively supported, and does it work on newer machines, especially TT030 and Falcon? In particular, have there been any post 1988 releases of:

CAD-3D
Cybermate
Cyber Control

One final question: Is there any facility for stereo viewing on the either the TT030 or the Falcon? I am considering acquiring a newer machine, but would hate to lose my investment in software, and my geeky StereoTek glasses.

Nothing would surprise me after my adventures with an STE of the first series
and my SH204. Atari don't seem to test their new computers with hard disks.
It seems they prefer to use early computer buyers for beta testers.

4567. Re: The Falcon Does NOT have True Colour

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 09:19:46 UTC
From: boris@sys6626.bison.mb.ca
Message-ID: <NRV9sB2w165w@sys6626.bison.mb.ca>
Source record: 215722

True colour was always a subjective term as far as I knew. It meant having sufficient numbers of different colours on the screen that the eye couldn't pick them out seperately.

If there aren't 16 million pixils on the screen then 16 million colours is useless. The human eye can't tell even a fraction of the reds apart from each other.

The falcon has the necessary number of colours needed to fool the eye into believing what's on the screen is a life-like or photo-quality image. That's true colour. More colours than that is just techno-overkill.

It's like saying your machine is a gadzillion Mhz and better for it, when all it can do is wordprocess at 60 words a minute.

If you don't need it or can't use it, it's just extra junk.
Extra junk you end up paying big bucks for.

Message-ID: <1cgf2bINN20f@agate.berkeley.edu>
Source record: 215720

Well I couldn't resist this one. The Toaster is an impressive accomplishment but Atari users may not know the Toaster only works in the Amiga 2000. An independant company produced a kludge for the 3000 and there seems to be no chance for the Amiga 4000 to house a toaster. New Tek can't even keep up own their native platform let alone port to a new computer.

As one of the anciouxsly (all bets on the correct spelling of that word is off) waiting-for-some-sort-of-X kind of people, I would like to make a few comments on the networking/non-networking issue.

It should have been established by now, that an X system (servers and clients) can be brought up on 1 machine, without TCP/IP or like network facilities. The discussion therefore boils down to the question of whether X without networking is *usefull*.

I can see the many advantegs of having networking X, but I will argue that (for me at least) even a non-networking X would hold many benefits.

The primary reason for this is that there are many X based programs of great interest, the most interesting for me being LucidEmacs (or Epoch). While they do not strictly need a fullblown X (one could in PRINCIPLE implement Xlib on top of GEM), it should greatly simplify porting stuff like LucidEmacs.

Secondly, it would provide a platform for developing programs that is not either text/curses based or confined to atari/GEM. The atari has almost all of the bells and whistles that I use in my everyday life at campus, except fancy graphics.

Usability is a religious a matter as editors and languages, but in my personal opinion, a non-networking X *would* interesting, and I *guess* that there is others thinking the same.

>numbers wrong. One is ground, and the other is +5v.

>Can anyone confirm this?... Is the guy that posted the original message
>wrong, are the specs that Atari released wrong, or is it wired wrong
>in the Flacon?

I'd be very surprised if that was true. At the CSS, I saw some
Falcons which had SCSI equipment hooked up to them, and they
seemed to work flawlessly. I know one of the guys who were
demonstrating stuff there, he had a drive for removeable 44MB
media connected to the Falcon via SCSI. I'll ask him about this
one next time I'll meet him.
As I just seem to remember, in one of the Falcon experience
reports that were posted recently, someone said he had tested a
Falcon with an SCSI HD, and there were no pinout problems
mentioned. I suspect there is a printing mistake in the specs
rather than a fault in the real pinouts.

>(It's probably too late now though...)

Hmm, the author of the original Spectrum version may have something to say
about that!

>Two quick questions....
>
>Are you going to do any more games?

Definitely. You might like to try out:
GEMS
TANX
GRAV
GRAV 2

all on a.a

>How did you do the samples? (I would *love* to be able to do that)

STOS Maestro plus sampler, from the amplified audio plug of my
stereo video.

>Thanks,
>Phil
>(E-mail naffara@uk.ac.crc)

Right, now for some xtra bits;

To the person who wanted a german keyboard layout;
I COULD easily do it, but its already been released and distributed,
so I'm sorry, you could write a remap program that remaps the keyboard
then resets the machine after prompting you to change disk.

TO the person that suggested using key values;

Good idea; there must be a reason that I chose to use the ASCII values,
but right now I can't quite remember it...

Thankyou for your co-operation,
Martin

From: bcballi@cs.vu.nl
Message-ID: <Bwq7qF.4M8@cs.vu.nl>
Source record: 215732

Hallo,

I'm looking for the most recent version of the sozobon C compiler.
The current version I have is 2.0 but it doesn't iclude any
documentation. And beside that, it also doesn`t work properly.
The code to clean up the stack is add.w in stead of add.l this
goes almost always right, but still it is wrong. Also there is a
bug in dstart.o when you use de Supexec binding/call.

Groeten,

Gerco Ballintijn (bcballi@cs.vu.nl)

Has anyone out there ever heard of or played the Imageworks adventure game called "Theme Park Mystery"?

I have had the game for some time now but cannot get very far with it. The main problem is that there is not a save game facility on it. Is there a way around this? (cheats, hints).

I have obtained a lot of the hints inside the game but cannot find any dragon and also cannot seem to get anywhere in the dreamland section. Any help at all with this game would be greatly appreciated.

Cheers,
Dean (Dean.Rose@brunel.ac.uk)

4578. Tape backups - ARCHIVE VIPER 150s

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 12:01:33 UTC
From: craig@hadrian.uk.sun.com
Message-ID: <13708@texsun.Central.Sun.COM>
Source record: 215726

I have got an ARCHIVE VIPER 150S working with an ICD - The Link, interface using Alan Hourihane's software. But the program mt.ttp doesn't seem to work. I try to issue a REWIND to the drive and the program just returns to GEM. In fact any command issued from mt.ttp doesn't seem to work. I have the timeout for the drive set at 32000 at the moment. Should I reduce this or increase it maybe. Also do I have to back up the whole disk partition everytime, can't the program just backup used sectors.

The dump.ttp works fine for single partitions, but I can't seem to get the dump.ttp to dump multiple partitions using the command as follows....

-a CDEF Master Midifiles Data Publishing

Is this the correct format for the command. Again the program just returns to GEM after issuing this command. This makes it impossible for me to do unattended backups.

Any help on this would be appreciated.

Craig

PS: My machine is a very early 1040STF with TOS 1.0, should I upgrade this TOS and what version should I upgrade to. Also what is the internet address of GENie, so I can get the ICD boot prog version 6.0.4.

Lattice C5 for the ST has an option to suppress warning messages when the C++ front end is used
so (Assuming a Lattice C++ front end really exists) all Hisoft would have to do to produce a good
C++ compiler for the ST would be to recompile the front end. I don't know how much Lattice Inc
would charge for the licence though.

> minimal communications library, as done on Linux. But we can't.

Why not ?

I would say that it *ought* to be possible to run an X server / clients on an ST(e/FM) given (say) 4Mb of memory and shared libraries. The shared texts that are supposed to be in MiNT 0.96 are the first stop along the way to shared libs, but on their own don't really go far enough. I'm not belittling them - they'll be very handy for running more than 1 shell at a tiem for example, but X libraries are *VERY* big (ask anyone using Ultrix :-), and they need to be shared unless you have oodles of cpu and disk bandwidth to spare.

I wasn't aware that you wanted to serve clients to your ST. I would have thought that was a smaller demand than those who want to take the X source home and compile it then run it on their ST. I would certaily fall into that category...

Simon.

In article <92298.110236JJMCWILL@MTUS5.BITNET> Jeff McWilliams <JJMCWILL@MTUS5.BITNET> writes:
>Is there anything like Mathematica or Maple for the Atari?

Yes.

(1) Maple version 4.2 is available for the Atari. I have a copy right here beside me. :-).

It's now distributed by Waterloo Maple Systems - for more information on availability, I suggest you frequent sci.math.symbolic. Keith Geddes, of the Symbolic Computational Group at the University of Waterloo, frequents the group and is more in the know than I; I picked up my copy when I was a student there (nice price - about $90 - make sure they know you're a student!)

(2) Form - Yet Another Algebraic system. Available on Atari.Archive.umich.edu. This one's free; it's supposed to be particularly good at working with large polynomial expressions. I could never get it working, but then I didn't try very hard.

(3) Pari - One of the other "free" math systems. I think it's at a.a.um.e... I stand to be corrected on this...

If you're intending to do something more specific in terms of math, suggest your favorite application. I've collected some "math stuff" that runs on the Atari, and might have some pointers. My interests tend to lie in the mathematical programming/linear programming area, and NOT in sadistics^H^H^H^H^H^H^H^H^Hstatistics.

> The colour of a pixel is independant of the colours of all other pixels
> if and only if there are more colours available than there are pixels.

You (and the original poster) are getting confused between the meanings of "independent of" and "different from".

You only need more colours than pixels if you want the colour of each pixel to be "different from" that of every other pixel.

If the colour of a pixel is "independent of" all the other pixels, it just means that you can change the colour of a pixel without changing any other pixels at the same time. It doesn't matter if two pixels are the same colour, so long as you can change them both separately. You don't need more colours than pixels to achieve this.

Or to put it another way, if you are digitizing a picture, True Colour means that for each pixel you can select the nearest colour out of your 32768, 65535, 16M or whatever, without having to consider what colours you have/will set other pixels to (i.e. independently), and without being concerned with the management of a Colour Look-Up Table or Pallette.

4586. The Falcon DOES have true colour

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 14:05:05 UTC
From: s.smith01@ic.ac.uk
Message-ID: <9210261405.AA22016@cscmgb.cc.ic.ac.uk>
Source record: 215736

What Atari call true colour is the same as that on some souped up VGA
boards (ET4000 i think?) which is 32768 colours. Falcon can do 65536 in
one of the modes (at least).
This is pretty healthy for most graphics appliactions. It's pretty good
for raytracing etc. (5/6 bits per red/green/blue) I know a 64-shade
greyscale on VGA monitors looks ok. Besides, any inability to
reproduce a specific colour is far more likey to be caused by the
colour gamut of the monitor that those extra 2 bits per colour plane.
(i think?) however many bits you have, you are still limited by the
phosphors in the monitor to a certain range of colours. You are just
dividing that range up finer and finer...

BTW, has *anyone* actually *seen* a Falcon in the UK? Silica, Gasteiner, and
someone else (don't remember) are advertising them, but ....

There's where the misunderstanding comes in, I think. The people to whom
you were responding were talking about running the server and client on
the same machine.

> If we
> had both client and server running on the same machine, then we could do a
> minimal communications library, as done on Linux. But we can't.

We can't run both client and server under TOS, but we certainly could
under MiNT or MultiTOS (both of which provide pre-emptive multitasking,
with the number of active processes limited only by the amount of
memory present).

For that matter, even under TOS you could use SLIP or PPP to connect to
a client on another machine, e.g. via the RS232 port or via the LAN
serial port on TT's or Mega STe's.

Date: 1992-10-26 14:43:57 UTC
From: jbraatz@astro.umd.edu
Message-ID: <16345@umd5.umd.edu>
Source record: 215740

If you want these two books, they're yours for $8 plus shipping. They are very helpful if you're interested in programming the ST, learning about the hardware, and learning about the innards of the operating system.

Jim

jbraatz@astro.umd.edu

4591. LEGEND (the recent mindscape game) help!

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 15:00:26 UTC
From: rasas@minyos.xx.rmit.oz.au
Message-ID: <rasas.720111626@minyos.xx.rmit.OZ.AU>
Source record: 215746

I'm stuck in Legend on level two..I've found 3 'ornate' keys and I need one more (it seems) any hints?

BTW, not a bad game, a little samey but nevertheless entertaining.

Greg.

4593. Re: The Falcon Does NOT have True Colour

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 15:31:13 UTC
From: g.coulter@daresbury.ac.uk
Message-ID: <1992Oct26.153113.7435@gserv1.dl.ac.uk>
Source record: 215742

I am not sure what of the amount of colors that the Falcon can display but in order for machine to be true color you need 16.7 million colors in the palette. True color means what it says ie the number of colors needed to define an image as the eye would see it in real life. The number of shades of Red Green & Blue in TC is 255 this is enough to convince the human eye.

Now the size of the screen does not matter most workstation screens are 1024 * 1024 or bigger if the hardware supports true color the max number of pixels on screen is only 1048576. To have all 16.7 mil colors on the screen at once would need a screen resolution of 4096 * 4096. For most purposes today the use of psuedo color systems ie a limited number of colors from 16.7 million colors is quite adiqute as in most cases now the limited number of colors is still larger than the display can handle.

ie 320x200 colors can be true color if the under lying palett is 16.7 million colors.

TRUE COLOR := Could you have 16.7 million colors on the screen were the screen resolution large enough.

YES = True Color.
NO = Psuedo Color if limited color range ie 256,000 colors max from 16.7 palette.

Gary.

4594. SPEECH.TOS -- help needed (2)

>from each other.

If that's so and there were 16 million pixels, it would still be useless.
Besides, Falcon images in the 32000 color mode are still typical computer
images (just consider that if you only use grey you'll only have 32 scales!)

>The falcon has the necessary number of colours needed to fool the eye
>into believing what's on the screen is a life-like or photo-quality
>image. That's true colour. More colours than that is just
>techno-overkill.

Here, you're talking about the palette screen modes; but -if I'm right- the
Falcon has only 256 different colours to offer in the 200.000 colour mode which
is again definitely not sufficient for all pictures. (Or am I incorrect and is
there a resolution that does 32.000 palette indexed colours? No, because that
would make the 32.000 5+5+5 mode redundant.)

>? Knowledge is no virtue and innocence no vice ?

According to Atari's definition, True Color means no Color Look-Up
Table (CLUT). To get a better understanding of this, let's examine
two video modes of the Falcon: The VGA Mode (640x480 resolution with
256 colors out of 262,144) and the True Color Mode (640x400 resolution
with 65,536 colors).

In the VGA mode, each pixel is represented by 8-bits. These 8-bits
are an index to a CLUT. The entries in the CLUT are 18-bits long. To
```

determine the color of a pixel, you first must use the 8-bit value as an index to a table (CLUT). The color of that pixel is the corresponding value in the table.

Hence, you can specify a total of 256 (2^8) colors out of 262,144 (2^18). In other words, the 8-bits of a pixel _indirectly_ specify the color of the pixel.

By contrast, the True Color Mode does not use a CLUT. Instead, each pixel is represented by 16-bits which _directly_ specify the color of that pixel. In other words, instead of being an index to a table, the bits represent the _true color_ of that pixel. With 16-bits, you can have a total of 65,536 (2^16) colors.

That's why Atari uses the term True Color. The bits of a pixel represent the true color of that pixel instead of being an index to a color table.

I personally like this definition. It's very logical and consistent.

The Falcon can therefore be said to have 16-bit True Color as opposed to 24-bit True Color. By the way, I think some NeXT workstations have a 12-bit True Color mode (and they actually used the term True Color to describe this mode in their literature).

4599. Re: Xwindows/Minx

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 16:24:34 UTC
From: grier@bnr.ca
Message-ID: <1992Oct26.162434.13705@bnr.ca>
Source record: 215748

I agree that it is not practical to run XWindows as a server only on an ST. No one has put the work into the driver. The system that Lockheed had developed communicated over the RS-232 port, and it was not a very fast system, but it did do what we needed at the time.

The version of X actually ran as a program and desk-accessories could be run as clients on the same box, but we did not do it since TOS is not pre-emptive. The important thing is it can be done!

If Xwindows was ported to the ST/TT/Falcon then once TCP/IP was made available a "simple" change could be made to allow the communication over that port. For that matter why not communicate over an X.25 network. You can purchase a PAD to take care of the X.25 protocol, and then you only need to worry about the data stream. This would allow an ST/TT to be price competitive, not really feature competitive with the low end X terminals.

4604. Suggestions for inclusion in my new game

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 19:10:53 UTC
From: mjb@cs.nott.ac.uk
Message-ID: <1992Oct26.191053.13439@cs.nott.ac.uk>
Source record: 215651

Hi, I am about to start writing a new game, which will properly exploit (possible wrong choice of word there) the shareware principal. You may have played one of my other games, I wrote the following;

CHAOS (the one that clogs up this group)
GRAV 2
GRAV
TANX
GEMS

and those are just the ones on a.a

The game is basically going to be a futuristic RPG, with a viewpoint like Ulitma VI's and a multi-planet playing area. The program you would get from the PD library would be an incomplete version, with registration bringing you the full game.. Once registered, you would get the opportunity to buy extra missions/planets for use in the game, which you would be able to go to at any time, once the relevant bits had been installed on your save disk. Obviously, it would be better run from a HD, but I'm going to try to limit the disk swaps for single disk users, unlike in Ultima VI !!

What I want to know is, how many of you would be interested in this game? and if you have any ideas to implement in it.. Any ideas used would gain you a credit in the title screen...

Please make any replies fast. I don't mind if you post directly to me or to the newsgroup, just please post, even if its only to say, I want you to write this game, because if I don't get enough replies, it simply won't get written...

Martin

4605. * A new demo from Omega *

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 19:13:54 UTC
From: d1matte@dtek.chalmers.se
Message-ID: <d1matte.720126834@dtek.chalmers.se>
Source record: 215661

Hi everybody!

Omega has finally released a new demo. It is called Grotesque.
It can be found at ftp atari.archive.umich.edu (141.211.164.8) and
ftp.uni-kl.de (131.246.9.95). The filename is omega_92.prg.
It was released yesterday (25 Oct 1992).

Dont expect any wiz-coding here. But all people that are bored of
just-another-scroll-demos will hopefully like this anyway.

And all the peolpe that this thinks this demo is lame with just some
pictures, flashing colors and sampled music, I can tell you that this
demo consist of ca 100 1-bitplane pictures and 400KB sampled music.
To squeeze this into a 1-meg machine all pictures are packed in memory
and realtime depacked in the demo. The depacker uses half a vbl.
I am also pretty sure that we got the fastest polygon routine on
both STE and TT (two different routines). The demo is coded in 3 weeks.

Important
The demo will only run a 1-meg (or more) STE/MSTE or a TT. It is
harddrive installable but on a 1-meg STE it must be run from the
AUTO folder due to the memory usage of TOS. Another problem is
coldbooting the demo on a machine with TOS 2.0x, because you have
to press space to get running. This will cause the demo to exit when
loaded. To tackle this just press reset after coldbooting.
It takes long time loading and depacking the demo if run from diskette,
have patience!
You MUST connect a 500W stereo at full volume when watching this demo :-)

If you have any troubles running this demo, contact me, I WANT TO KNOW!
Hopefully we can work it out.

Since it is almost 4 years since we last realeased an own demo and almost
3 years since we last released anything we would like you take the next
paragraph very seriously. It is also pretty different, something like
the acid demos around.

When you have watched the demo, I would be very pleased if you would
mail me any opinions you might have. Mail me anything, a 10K textfile with
ingoing discussion on the demo or just a sentence about why you didnt like
the colors in the middle of the demo. Mail me positive AND negative
critsism. Just mail me! If we dont get response why should we work our buts
off? (ok there is a reason: win competitions (we have for ex. won a TT
and 3000 SEK)).

Hope you like it!

Mattias Karlgren (Haq of Omega) Email: d1matte@dtek.chalmers.se

4606. sources from LAPD

Newsgroup: comp.sys.atari.st
Date: 1992-10-26 19:14:09 UTC

Okay, what do I do when the kermit on the machine I'm connected to won't let me set a packet-length longer than 94 and doesn't know what 'window-size' is. I get the same message on both a Convex and a Sun 4 (both unix).

And Kermit is the only protocol loaded on either machine!!

>>
>> I think that would be swell.

Me too! Somebody PLEASE upload Chaos to GEnie.

>I heard that GEnie claims copyright on all programs uploaded to it; I
>don't know if this is true (if so, don't do it!).

This is not true. Only those files marked as copyright General Electric (or
GEnie) are not freely distributable. This usually applies only to conferences
held on GEnie and the like. I think there was some hassle about this earlier
but it has been cleared up now.

>btw, is there any way of downloading from GEnie?

Sure. What good would an on-line service be if you couldn't download files?
Uploads are free but downloads cost you $4.95 (or is $5.95) per hour at 300,
1200 or 2400 baud evenings, weekends or holidays. Day rates are much higher.
There are more Atari files on GEnie than PC, Mac or Amiga.

BTW, GEnie's Atari RoundTable areas are the most active of all on the network
and represent a considerable value over the exorbitant (IMHO) cost of Compuserve.
The $5.95 per month flat fee for GEnie Star Services gives you unlimited access
to email and a host of online services.

I'm not affiliated with GEnie, just a happy user for many, many years.

Yes, you can create ACC files with GFA 3.5 and 3.6. There are example ACC files that come with the compiler which demonstrate how easy it is to do.

Several of the earlier Intel chips (8080?, 8086?) multiplexed the data and
address buses. When Motorola designed the 68000 they didn't want to do that.

Why not use the keypad keys (7,8,9,4,5,6,1,2,3) or a joystick to contol
the cursor. Since all ST's have a keypad and most have a joystick handy,
this would be a great improvement.

Just a suggestion to improve this already very entertaining game.

The other games: KV_Me1st, KV_House, KV_Fonics, KV_Geo, etc. I think are much better. Potato, KidMixup and Aiken Drum by DM Blumleave seem primitive by comparison. The 2 year old would probably find KV_House entertaining and KV_Me1st challenging.

>Hi There,
>It's possible with the GFA Basic to create an accessory program ?

Yes, that's perfectly possible.

>How ? Are there any programming rules to follow ?

Well, I've played around with accessory programming years ago and never really got serious about it... my understanding is that, first of all, you have to do a MENU_REGISTER call to register your accessory into the "DESK" menu. Next, you basically have to do an endless loop (DO ... LOOP), waiting for a message event to occur (~EVNT_MESAG(V:mbuf&(0))). If you receive the AC_OPEN event (read: IF mbuf&(0)=40), you execute your accessory program code. But you have to watch for the AC_CLOSE event (mbuf&(0)=41), which will be triggered upon exiting of the current main application. Well, that's an incomplete list of things to remember... if you need more, email me, I may be able to dig out the stuff I did back then...

>I have the Gfa 3.5 E and the 3.6 German version with the compiler.

Check out the compiler manual and the disks. I think there was some sample code on accessory programming.

>size' is. I get the same message on both a Convex and a Sun 4 (both unix).
>
>And Kermit is the only protocol loaded on either machine!!

Then it means that the Kermit on those two machines is obsolete and should
be updated. If that isn't done, then you are doomed to either amazingly
slow file transfers or, if your are downloading text files and your
terminal program supports it, downloading using ASCII capture.

:^) I was talking to someone on the phone today,
:^) and they told me that someone had posted a message on another network
:^) about the Falcon's SCSI2 port, saying that looking at the pinouts
:^) in Atari's specs for the machine, that if you plugged a SCSI drive
:^) in it, it would either kill the Falcon or the drive. I think he
:^) said that pins 5 & 11 were around the wrong way, but I may have those
:^) numbers wrong. One is ground, and the other is +5v.
:^)
:^) Can anyone confirm this?... Is the guy that posted the original message
:^) wrong, are the specs that Atari released wrong, or is it wired wrong
:^) in the Flacon?

I took a standard 50 pin 'Honda' connector cable from a DECstation and plugged one end into the Falcon, the other into my Seagate drive. The drive was ICD formatted and operated flawlessly on the falcon. Data traveled fine in and out of the SCSI2 port, with neither the computer or the drive damaged. At least on the Falcon I tested, there is no apparent problem with the port.

From: wmagro@uiuc.edu
Message-ID: <BwrK3u.Mow@news.cso.uiuc.edu>
Source record: 215680

The X Server for the mac is functional with 1.5 meg of ram allocated. I usually use 3.5 meg, which is enough for several clients on my 19" color monitor. I can even zoom some one window at a time to full screen size if the other windows are modest in size. This is all without virtual memory turned on. Of course, the TCP/IP stuff is in the apple OS, so that would add a little. I think a simple x server would be quite feasible. One trick the mac (and NeXT) server uses is 'rootless' displays. Because these displays don't need to allocate memory for a root background, their memory requirements are lower. The mac server has four displays, for the various combinations of color/mono rooted/rootless.

Source record: 215688

To silence (maybe) the cretin/s who were complaining about not being able
To silence (maybe) the cretin/s who were complaining about not being able
to do batch uploads with FZDSterm - I've discovered how to bypass the
'Upload file list' that FZDSterm creates, and then sends to XYZ201.TTP!

For the 'Uploads' list - try this for Z_Modem....

-Z -U -S -A -I #9

the #9 can be any number from 1 to 9, which gives the maximum number of
batch files that can be sent at once!! So, instead of using FZDSterms
built in batch-file selector - you are, (when selecting Z-Modem upload) given
a file-selector with which to select the 1 to 9 files you wish to upload!

(The usual maximum is 10, this method only gives you 9, but that's enough
for most purposes).

By 'usual' I mean using FZDSterm, you can using a word-processor/text-
editor etc. Edit the TEMPSEND.BQL to select up to an X amount of files -
but this is too manual for most people!

You can do the same with Y-Modem G Batch if you are using XYZ v2.02B
(or probably, another protocol!!)

This works okay!! And, it gives you more than the standard 30 (or whatever
the dialog box usually lets you enter) character Parameter listing too!

Confused? No - good!

BTW - does anyone know what the

-A

Switch is? FZDSterm sends it to XYZ.TTP - and no complaints arise - so
what does it do??

XYZ 2.02B now supports 32-bit CRC's and Y-Modem G!! (Y-Modem G often
gives me 240cps on a 2400 baud modem - not bad at all!! max' speed!)

I received a lot of reply regarding my problem with UW.
And actuallu most of you guest correctly that I wasn't
using a monocrome monitor. Now it run with a
mono emulator.
Thanks a lot!

by the way, is there any other progarm out there that work
like UW?

>
>Adam

The only problem with posting it on GEnie is the cost of getting it down..

I have found that it does not need to be MSAed but should be LZH201x and posted to comp.binaries.atari.st

Also if you don't have a 1 meg machine forget it, also you need a good Ram disk that can take the archive and the depacker what ever all in a one meg machine or larger...

>number of shades of Red Green & Blue in TC is 255 this is enough to
>convince the human eye.

24 bit true colour systems are only that cos computers can handle them
better, ie 8 bits (one byte) per colour value per pixel, it has nothing to
do with what the eye can resolve!

All that True Colour means is that there is no colour lookup table. The
Sinclair QL had true colour, ok, so it was 4 bit true colour.. so what!

>
>Now the size of the screen does not matter most workstation screens

>
> YES = True Color.
> NO = Psuedo Color if limited color range ie 256,000 colors max
> from 16.7 palette.
>
>Gary.
>

I am getting sick to death of all this drivel about true colour being
something to do with the size of the display.. you'll be telling me next
that the human eye is a pseudo clour device cos it can resolve more pixels
than it can colours!

Now, on the point of "is 16 bit colour any good?", yes it is.. it is close
to the colour resolution of the human eye. The only problem I see is with
grey-scale images, but two bits of brightness resolution should not make

much difference at all.

I'm sorry if this seems like a flame.. it isn't really.. I'm just a bit fed up with the way this discussion is just bouncing between a couple of people and getting nowhere!

There is another commercial system available here in Germany, it's called
RIEMANN II.
The price is appr. DM 400.- ; I never tried it (but thought about byuing).
For further information I have to scan my library at home.

Strange. Why does everybody call 2^24 16.7 million when it really is 16,777,215 and should thus be rounded to 16.8 million? Is this just because one man made a mistake and everybody else took it over without recalculating or is there a deeper meaning (like the darkest colours look the same anyway)? It's not just this newsgroup, even in ads and articles in mags you see 16.7 million.

Just wondering,

>
> Are there any conversion utilities to allow ST's to
>display JPEG images and anims? What is JPEG anyway, my guess
>is that it is an IBM world standard.

Well, I certainly wouldn't call it an IBM world standard. It probably most popular amongst color workstations and people with 24 bit color boards.
What hasn't been mentioned yet is that one of the best values of JPEG is that it handles full 24 bit pictures as opposed to GIF which can only hadle up to 256 colors. The compression can be quite good even at 95% quality setting, and pictures are virtually indistinguishible even down to 60-70% settings (which give higher compression ratios). But JPEG is for real world images with lots of colors. JPEGing simple pictures tends to produce artifacting. So the GIF format is still useful for simple pictures with fewer colors.

The format most people use to view JPEGs is to convert them to GIF then convert the GIF to SPC. DJPEG.TTP (decompress JPEG) can need a *lot* of memory, and I haven't been able to get the memory limiting option to work. So some large pixmaps can't be converted yet with DJPEG on an ST.

If you have the PbmPlus utilities (and a good shell), you can use DJPEG to convert a JPEG to a PPM (retaining the 24bit color), scale it down to 320x200, and convert it to a RAW for use with PhotoChrome which makes better pictures than Spectrum. But PPMs can reach 1meg very fast so this conversion is not easy (or sometimes possible depending on your setup).

There is not a decent or useful JPEG viewer for ST/STEs that I know of. Sombody said that Gemview or Viewgif may support the JPEG format.

From: ae24@iamk4516.mathematik.uni-karlsruhe.de
Message-ID: <1992Oct27.093741.677@rz.uni-karlsruhe.de>
Source record: 215691

Hi.

I tried to post this message yesterday, but it has obviously
disappeared somewhere in space. Maybe the inhabitants of Mars
are enjoying it right now ...

Ok, I got some questions concerning GNU C. I tried to install
it on my TT, but it wouldn't work right. Maybe someone out there
will be able to help me in the following points :

1) The header files I got are obviously in UNIX text format.
That is surely no problem because I can convert them to Atari
format easily.
But the cpp preprocessor generates UNIX format files too and
the cc1 compiler wouldn't process them.
So if you want to compile a program you have to run the preprocessor
then convert the .i files and then run the cc1 compiler. This
is surely not too comfortable. One would rather like to type
'gcc myfiles.c -other_options' and then watch the show...
Can someone tell me how to accomplish that ?
Note : I use the Gulam shell as my CLI.

2) When running cc1, it will search for a file named 'crt0.o' which
wasn't in the package. Can someone tell me where to get it ?
Maybe someone could mail me an uuencoded version if the file is
not too large...

Please send your answers via e-mail to :

ae24@iamk4516.mathematik.uni-karlsruhe.de

Thanks a lot in advance.

: > If there aren't 16 million pixils on the screen then 16 million colours
: >is useless. The human eye can't tell even a fraction of the reds apart
: >from each other.
:
: If that's so and there were 16 million pixels, it would still be useless.
: Besides, Falcon images in the 32000 color mode are still typical computer
: images (just consider that if you only use grey you'll only have 32 scales!)

If you pick up a book about computer graphics you will find that 32 is
quite sufficient. There isn't much difference between 32 and 64 and almost
no visible difference between 64 and 256.
Besides why anyone would use the 32K/64K colour mode for grey scales is
beyond me. If you limit yourself to a fraction of the palette anyway you
might as well use a LUT-mode.

OK. I will ask CS. You should be able to find most of them by using the strings command (or any "disk editor" type of program) and looking at the shell binary and resource files. Also, some of the names should be obvious from the setup dialogs within the shell. One day I'll run a CLI from the TeX shell and execute printenv :-)

>ps. I can't get cs-tex up because I can't get initex to see its files, no

> of SPEECH.TOS (more preferable).

healy@nosc.mil (Mike Healy) writes:

I have a c function that you pass a string to and it speaks
it using speech.tos. I think someone just uploaded a similiar
function to terminator.

And I found it! It's:

ftp : atari.archive.umich.edu
dir : Applications/Other
file: talkspk.arc
size: 57813 bytes

The program sample shows how to execute SPEECH.TOS in "staying
resident" mode. It then sends strings of text to the program by
filling its stdin buffer.

So I guess my problem has been solved.
I want to thank the following people for helping me out:

By your definition, the hi-res ST mode (640x400x2) is True Colour! Eg I can
digitise a picture, choose the nearest colour (black or white), then
can change each pixel directly. And there is no CLUT. :-)

True Colour, to me, is meaningless marketing term.
